

Disjoint Union / Find

CSE 326
Data Structures
Unit 13

Reading: Chapter 8

Equivalence Relations

- A relation R is defined on set S if for every pair of elements $a, b \in S$, $a R b$ is either true or false.
- An **equivalence relation** is a relation R that satisfies the 3 properties:
 - › **Reflexive**: $a R a$ for all $a \in S$
 - › **Symmetric**: $a R b$ iff $b R a$; for all $a, b \in S$
 - › **Transitive**: $a R b$ and $b R c$ implies $a R c$

2

Equivalence Classes

- Given an equivalence relation R , decide whether a pair of elements $a, b \in S$ is such that $a R b$.
- The **equivalence class** of an element a is the subset of S of all elements related to a .
- Equivalence classes are **disjoint sets**

3

Dynamic Equivalence Problem

- Starting with each element in a singleton set, and an equivalence relation, build the equivalence classes
- Requires two operations:
 - › **Find** the equivalence class (set) of a given element
 - › **Union** of two sets
- It is a **dynamic** (on-line) problem because the sets change during the operations and Find must be able to cope!

4

Disjoint Union - Find

- Maintain a set of disjoint sets.
 - › {3,5,7} , {4,2,8}, {9}, {1,6}
- Each set has a unique name, one of its members
 - › {3,5,7} , {4,2,8}, {9}, {1,6}

5

Union

- Union(x,y) – take the union of two sets named x and y
 - › {3,5,7} , {4,2,8}, {9}, {1,6}
 - › Union(5,1)
 - {3,5,7,1,6}, {4,2,8}, {9},

6

Find

- Find(x) – return the name of the set containing x.
 - › {3,5,7,1,6}, {4,2,8}, {9},
 - › Find(1) = 5
 - › Find(4) = 8

7

An Application

- Build a random maze by erasing edges.

8

An Application (ct'd)

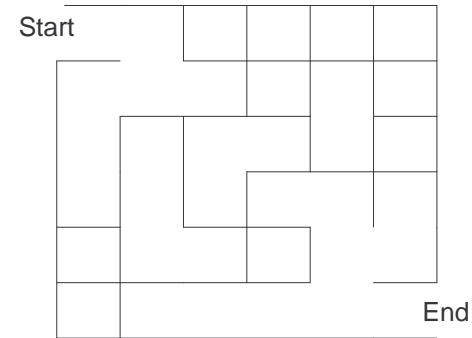

- Pick Start and End

9

An Application (ct'd)

- Repeatedly pick random edges to delete.

10

Desired Properties

- None of the boundary is deleted
- Every cell is reachable from every other cell.
- There are no cycles – no cell can reach itself by a path unless it retraces some part of the path.

11

A Cycle (we don't want that)

12

A Good Solution

13

Good Solution : A Hidden Tree

14

Number the Cells

We have disjoint sets $S = \{ \{1\}, \{2\}, \{3\}, \{4\}, \dots, \{36\} \}$ each cell is unto itself.
 We have all possible edges $E = \{ (1,2), (1,7), (2,8), (2,3), \dots \}$ 60 edges total.

Start	1	2	3	4	5	6	
	7	8	9	10	11	12	
	13	14	15	16	17	18	
	19	20	21	22	23	24	
	25	26	27	28	29	30	
	31	32	33	34	35	36	End

15

Basic Algorithm

- S = set of sets of connected cells
- E = set of edges

```

While there is more than one set in S
  pick a random edge (x,y)
  u := Find(x); v := Find(y);
  if u ≠ v then
    Union(u,v) //knock down the wall between the cells (cells in
    . Remove (x,y) from E //the same set are connected)
    
```

- If $u=v$ there is already a path between x and y
- All remaining members of E form the maze

16

Up-Tree for DU/F

Initial state 

Find Operation

- Find(x) follow x to the root and return the root

Union Operation

- Union(i,j) - assuming i and j roots, point i to j.

Simple Implementation

- Array of indices (Up[i] is parent of i)
- Up [x] = 0 means x is a root.

	1	2	3	4	5	6	7
up	0	1	0	7	7	5	0

Union

```
Union(up[] : integer array, x,y : integer) : {  
  //precondition: x and y are roots//  
  Up[x] := y  
}
```

Constant Time!

25

Find

- Design Find operator

- › Recursive version
- › Iterative version

```
Find(up[] : integer array, x : integer) : integer {  
  //precondition: x is in the range 1 to size//  
  ???  
}
```

26

A Bad Case

27

Weighted Union

- Weighted Union (weight = number of nodes)

- › Always point the smaller tree to the root of the larger tree

28

Example Again

29

Analysis of Weighted Union

- With weighted union an up-tree of height h has weight at least 2^h .
- Proof by induction
 - › Basis: $h = 0$. The up-tree has one node, $2^0 = 1$
 - › Inductive step: Assume true for all $h' < h$.

30

Analysis of Weighted Union

- Let T be an up-tree of weight n formed by weighted union. Let h be its height.
- $n \geq 2^h$
- $\log_2 n \geq h$
- Find(x) in tree T takes $O(\log n)$ time.
- Can we do better?

31

Worst Case for Weighted Union

$n/2$ Weighted Unions

$n/4$ Weighted Unions

32

Example of Worst Cast (cont')

After $n - 1 = n/2 + n/4 + \dots + 1$ Weighted Unions

If there are $n = 2^k$ nodes then the longest path from leaf to root has length k .

33

Elegant Array Implementation

Can save the extra space by storing the complement of weight in the space reserved for the root

34

Weighted Union

```

W-Union(i,j : index){
  //i and j are roots//
  wi := weight[i];
  wj := weight[j];
  if wi < wj then
    up[i] := j;
    weight[j] := wi + wj;
  else
    up[j] := i;
    weight[i] := wi + wj;
}
    
```

35

Path Compression

- On a Find operation point all the nodes on the search path directly to the root.

36

Self-Adjustment Works

37

Path Compression Find

```
PC-Find(i : index) {  
  r := i;  
  while up[r] ≠ 0 do //find root//  
    r := up[r];  
  if i ≠ r then //compress path//  
    k := up[i];  
    while k ≠ r do  
      up[i] := r;  
      i := k;  
      k := up[k];  
  return(r)  
}
```

38

Example

39

Disjoint Union / Find with Weighted Union and PC

- Worst case time complexity for a W-Union is $O(1)$ and for a PC-Find is $O(\log n)$.
- Time complexity for $m \geq n$ operations on n elements is $O(m \log^* n)$ where $\log^* n$ is a very slow growing function.
 - › $\log^* n < 7$ for all reasonable n . Essentially constant time per operation!

40

Amortized Complexity

- For disjoint union / find with weighted union and path compression.
 - › average time per operation is essentially a constant.
 - › worst case time for a PC-Find is $O(\log n)$.
- An individual operation can be costly, but over time the average cost per operation is not.

41

Find Solutions

Recursive

```
Find(up[] : integer array, x : integer) : integer {  
  //precondition: x is in the range 1 to size//  
  if up[x] = 0 then return x  
  else return Find(up,up[x]);  
}
```

Iterative

```
Find(up[] : integer array, x : integer) : integer {  
  //precondition: x is in the range 1 to size//  
  while up[x] ≠ 0 do  
    x := up[x];  
  return x;  
}
```

42
