

K-D Trees and Quad Trees

CSE 326
Data Structures
Lecture 9

Reading

- Chapter 12.6

K-D Trees and Quad Trees - Lecture 9

2

Geometric Data Structures

- Organization of points, lines, planes, ... to support faster processing
- Applications
 - Astrophysical simulation – evolution of galaxies
 - Graphics – computing object intersections
 - Data compression
 - Points are representatives of 2x2 blocks in an image
 - Nearest neighbor search

K-D Trees and Quad Trees - Lecture 9

3

k-d Trees

- Jon Bentley, 1975, while an undergraduate
- Tree used to store spatial data.
 - Nearest neighbor search.
 - Range queries.
 - Fast look-up
- k-d tree are guaranteed $\log_2 n$ depth where n is the number of points in the set.
 - Traditionally, k-d trees store points in d-dimensional space which are equivalent to vectors in d-dimensional space.

K-D Trees and Quad Trees - Lecture 9

4

Range Queries

Rectangular query

Circular query

K-D Trees and Quad Trees - Lecture 9

5

Nearest Neighbor Search

Nearest neighbor is e.

K-D Trees and Quad Trees - Lecture 9

6

k-d Tree Construction

- If there is just one point, form a leaf with that point.
- Otherwise, divide the points in half by a line perpendicular to one of the axes.
- Recursively construct k-d trees for the two sets of points.
- Division strategies
 - divide points perpendicular to the axis with widest spread.
 - divide in a round-robin fashion (book does it this way)

K-D Trees and Quad Trees - Lecture 9

7

k-d Tree Construction (1)

divide perpendicular to the widest spread.

K-D Trees and Quad Trees - Lecture 9

K-D Trees and Quad Trees - Lecture 9

25

2-d Tree Decomposition

K-D Trees and Quad Trees - Lecture 9

26

k-d Tree Splitting

K-D Trees and Quad Trees - Lecture 9

27

k-d Tree Splitting

K-D Trees and Quad Trees - Lecture 9

28

k-d Tree Construction Complexity

- First sort the points in each dimension.
 - $O(dn \log n)$ time and dn storage.
 - These are stored in $A[1..d, 1..n]$
- Finding the widest spread and equally divide into two subsets can be done in $O(dn)$ time.
- We have the recurrence
 - $T(n, d) \leq 2T(n/2, d) + O(dn)$
- Constructing the k-d tree can be done in $O(dn \log n)$ and dn storage

K-D Trees and Quad Trees - Lecture 9

29

Node Structure for k-d Trees

- A node has 5 fields
 - axis (splitting axis)
 - value (splitting value)
 - left (left subtree)
 - right (right subtree)
 - point (holds a point if left and right children are null)

K-D Trees and Quad Trees - Lecture 9

30

Rectangular Range Query

- Recursively search every cell that intersects the rectangle.

K-D Trees and Quad Trees - Lecture 9

31

Rectangular Range Query (1)

K-D Trees and Quad Trees - Lecture 9

37

Rectangular Range Query (7)

K-D Trees and Quad Trees - Lecture 9

38

Rectangular Range Query (8)

K-D Trees and Quad Trees - Lecture 9

39

Rectangular Range Query

```
print_range(xlow, xhigh, ylow, yhigh :integer, root: node pointer) {
  Case {
    root = null: return;
    root.left = null:
      if xlow ≤ root.point.x and root.point.x ≤ xhigh
        and ylow ≤ root.point.y and root.point.y ≤ yhigh
        then print(root);
    else
      if (root.axis = "x" and xlow ≤ root.value ) or
        (root.axis = "y" and ylow ≤ root.value ) then
        print_range(xlow, xhigh, ylow, yhigh, root.left);
      if (root.axis = "x" and xlow > root.value ) or
        (root.axis = "y" and ylow > root.value ) then
        print_range(xlow, xhigh, ylow, yhigh, root.right);
  }}
}
```

K-D Trees and Quad Trees - Lecture 9

40

Analysis of Rectangular Range Query

- Worst case time is $O(n)$ as seen by the pathological example.

K-D Trees and Quad Trees - Lecture 9

41

k-d Tree Nearest Neighbor Search

- Search recursively to find the point in the same cell as the query.
- On the return search each subtree where a closer point than the one you already know about might be found.

K-D Trees and Quad Trees - Lecture 9

42

k-d Tree NNS (15)

K-D Trees and Quad Trees - Lecture 9

55

Main is $\text{NNS}(q, \text{root}, \text{null}, \text{infinity})$

Nearest Neighbor Search

```

NNS(q: point, n: node, p: point, w: distance) : point {
  if n.left = null then {leaf case}
    if distance(q, n.point) < w then return n.point else return p;
  else
    if w = infinity then
      if q(n.axis) ≤ n.value then
        p := NNS(q, n.left, p, w);
        w := distance(p, q);
        if q(n.axis) + w > n.value then p := NNS(q, n.right, p, w);
      else
        p := NNS(q, n.right, p, w);
        w := distance(p, q);
        if q(n.axis) - w ≤ n.value then p := NNS(q, n.left, p, w);
      else // w is finite //
        if q(n.axis) - w ≤ n.value then
          p := NNS(q, n.left, p, w);
          w := distance(p, q);
        if q(n.axis) + w > n.value then p := NNS(q, n.right, p, w);
        return p
    }
  }

```

K-D Trees and Quad Trees - Lecture 9

56

The Conditional

K-D Trees and Quad Trees - Lecture 9

57

Worst-Case for Nearest Neighbor Search

- Half of the points visited for a query
- Worst case $O(n)$
- But: on average (and in practice) nearest neighbor queries are $O(\log N)$

K-D Trees and Quad Trees - Lecture 9

58

Notes on k-d NNS

- Has been shown to run in $O(\log n)$ average time per search in a reasonable model. (Assume d a constant)
- Storage for the k-d tree is $O(n)$.
- Preprocessing time is $O(n \log n)$ assuming d is a constant.

K-D Trees and Quad Trees - Lecture 9

59

Quad Trees

- Space Partitioning

K-D Trees and Quad Trees - Lecture 9

60

Quad Trees

- Space Partitioning

K-D Trees and Quad Trees - Lecture 9

61

Quad Trees

- Space Partitioning

K-D Trees and Quad Trees - Lecture 9

62

A Bad Case

K-D Trees and Quad Trees - Lecture 9

63

Notes on Quad Trees

- Number of nodes is $O(n(1 + \log(\Delta/n)))$ where n is the number of points and Δ is the ratio of the width (or height) of the key space and the smallest distance between two points
- Height of the tree is $O(\log n + \log \Delta)$

K-D Trees and Quad Trees - Lecture 9

64

K-D vs Quad

- k-D Trees
 - Density balanced trees
 - Height of the tree is $O(\log n)$ with batch insertion
 - Good choice for high dimension
 - Supports insert, find, nearest neighbor, range queries
- Quad Trees
 - Space partitioning tree
 - May not be balanced
 - Not a good choice for high dimension
 - Supports insert, delete, find, nearest neighbor, range queries

K-D Trees and Quad Trees - Lecture 9

65

Geometric Data Structures

- Geometric data structures are common.
- The k-d tree is one of the simplest.
 - Nearest neighbor search
 - Range queries
- Other data structures used for
 - 3-d graphics models
 - Physical simulations

K-D Trees and Quad Trees - Lecture 9
