

# Binary Heaps

CSE 326  
Data Structures  
Lecture 11

## Readings and References

- Reading
  - › Sections 6.1-6.4

Binary Heaps - Lecture 11

2

## A New Problem...

- Application: Find the smallest ( or highest priority) item quickly
  - › Operating system needs to schedule jobs according to priority
  - › Doctors in ER take patients according to severity of injuries
  - › Event simulation (bank customers arriving and departing, ordered according to when the event happened)

Binary Heaps - Lecture 11

3

## Priority Queue ADT

- Priority Queue can efficiently do:
  - › FindMin (and DeleteMin)
  - › Insert
- What if we use...
  - › Lists: If sorted, what is the run time for Insert and FindMin? Unsorted?
  - › Binary Search Trees: What is the run time for Insert and FindMin?

Binary Heaps - Lecture 11

4

## Less flexibility → More speed

- Lists
  - › If sorted: FindMin is  $O(1)$  but Insert is  $O(N)$
  - › If not sorted: Insert is  $O(1)$  but FindMin is  $O(N)$
- Balanced Binary Search Trees (BSTs)
  - › Insert is  $O(\log N)$  and FindMin is  $O(\log N)$
- BSTs look good but...
  - › BSTs are efficient for all Finds, not just FindMin
  - › We only need FindMin

Binary Heaps - Lecture 11

5

## Better than a speeding BST

- We can do better than Balanced Binary Search Trees?
  - › Very limited requirements: Insert, FindMin, DeleteMin
  - › FindMin is  $O(1)$
  - › Insert is  $O(\log N)$
  - › DeleteMin is  $O(\log N)$

Binary Heaps - Lecture 11

6

## Binary Heaps

- A binary heap is a binary tree that is:
  - › Complete: the tree is completely filled except possibly the bottom level, which is filled from left to right
  - › Satisfies the heap order property
    - every node is less than or equal to its children
    - or every node is greater than or equal to its children
- The root node is always the smallest node
  - › or the largest, depending on the heap order

Binary Heaps - Lecture 11

7

## Heap order property

- A heap provides limited ordering information
- Each *path* is sorted, but the subtrees are not sorted relative to each other
  - › A binary heap is NOT a binary search tree

These are all valid binary heaps (minimum)

Binary Heaps - Lecture 11

8

## Binary Heap vs Binary Search Tree

Binary Heap

Parent is less than both left and right children

Binary Heaps - Lecture 11

Binary Search Tree

Parent is greater than left child, less than right child

9

## Structure property

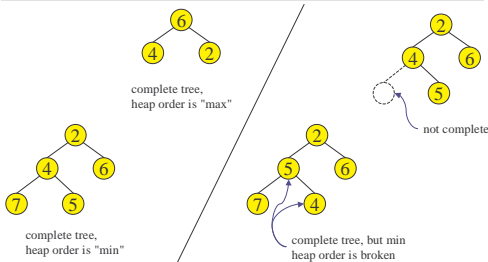

- A binary heap is a complete tree
  - › All nodes are in use except for possibly the right end of the bottom row

Binary Heaps - Lecture 11

10

## Examples

Binary Heaps - Lecture 11

11

## Array Implementation of Heaps (Implicit Pointers)

- Root node =  $A[1]$
- Children of  $A[i] = A[2i]$ ,  $A[2i + 1]$
- Keep track of current size  $N$  (number of nodes)

Binary Heaps - Lecture 11

12

## FindMin and DeleteMin

- FindMin: Easy!
  - Return root value  $A[1]$
  - Run time = ?
- DeleteMin:
  - Delete (and return) value at root node

Binary Heaps - Lecture 11

13

## DeleteMin

- Delete (and return) value at root node

Binary Heaps - Lecture 11

14

## Maintain the Structure Property

- We now have a "Hole" at the root
  - Need to fill the hole with another value
- When we get done, the tree will have one less node and must still be complete

Binary Heaps - Lecture 11

15

## Maintain the Heap Property

- The last value has lost its node
  - we need to find a new place for it
- We can do a simple insertion sort operation to find the correct place for it in the tree

Binary Heaps - Lecture 11

16

## DeleteMin: Percolate Down

- Keep comparing with children  $A[2i]$  and  $A[2i + 1]$
- Copy smaller child up and go down one level
- Done if both children are  $\geq$  item or reached a leaf node
- What is the run time?

Binary Heaps - Lecture 11

17

## Percolate Down

```
PercDown(i:integer, x :integer): {
// N is the number of entries in queue//
j : integer;
Case{
2i > N : A[i] := x; //at bottom//
2i = N : if A[2i] < x then
    A[i] := A[2i]; A[2i] := x;
else A[i] := x;
2i < N : if A[2i] < A[2i+1] then j := 2i;
else j := 2i+1;
if A[j] < x then
    A[i] := A[j]; PercDown(j,x);
else A[i] := x;
}}
```

Binary Heaps - Lecture 11

18

## DeleteMin: Run Time Analysis

- Run time is  $O(\text{depth of heap})$
- A heap is a complete binary tree
- Depth of a complete binary tree of  $N$  nodes?
  - ›  $\text{height} = \lceil \log_2(N) \rceil - 1$
- Run time of DeleteMin is  $O(\log N)$

Binary Heaps - Lecture 11

19

## Insert

- Add a value to the tree
- Structure and heap order properties must still be correct when we are done

Binary Heaps - Lecture 11

20

## Maintain the Structure Property

- The only valid place for a new node in a complete tree is at the end of the array
- We need to decide on the correct value for the new node, and adjust the heap accordingly

Binary Heaps - Lecture 11

21

## Maintain the Heap Property

- The new value goes where?
- We can do a simple insertion sort operation to find the correct place for it in the tree

Binary Heaps - Lecture 11

22

## Insert: Percolate Up

- Start at last node and keep comparing with parent  $A[i/2]$
- If parent larger, copy parent down and go up one level
- Done if parent  $\leq$  item or reached top node  $A[1]$
- Run time?

Binary Heaps - Lecture 11

23

## Insert: Done

- Run time?

Binary Heaps - Lecture 11

24

## PercUp

- Class participation
- Define PercUp which percolates new entry to correct spot.
- Note: the parent of  $i$  is  $i/2$

```
PercUp(i : integer, x : integer): {
    ???
}
```

Binary Heaps - Lecture 11

25

## Sentinel Values

- Every iteration of Insert needs to test:
  - › if it has reached the top node  $A[1]$
  - › if  $\text{parent} \leq \text{item}$
- Can avoid first test if  $A[0]$  contains a very large negative value
  - › sentinel  $-\infty < \text{item}$ , for all items
- Second test alone always stops at top

value	$-\infty$	2	3	8	7	4	10	9	11	9	6	5		
index	0	1	2	3	4	5	6	7	8	9	10	11	12	13

Binary Heaps - Lecture 11

26

## Binary Heap Analysis

- Space needed for heap of  $N$  nodes:  $O(\text{MaxN})$ 
  - › An array of size  $\text{MaxN}$ , plus a variable to store the size  $N$ , plus an array slot to hold the sentinel
- Time
  - › FindMin:  $O(1)$
  - › DeleteMin and Insert:  $O(\log N)$
  - › BuildHeap from  $N$  inputs :  $O(N)$

Binary Heaps - Lecture 11

27

## Build Heap

```
BuildHeap {
    for i = N/2 to 1 by -1 PercDown(i, A[i])
}
```

$N=11$

Binary Heaps - Lecture 11

28

## Build Heap

Binary Heaps - Lecture 11

29

## Build Heap

Binary Heaps - Lecture 11

30

## Analysis of Build Heap

- Assume  $N = 2^k - 1$ 
  - › Level 1:  $k - 1$  steps for 1 item
  - › Level 2:  $k - 2$  steps of 2 items
  - › Level 3:  $k - 3$  steps for 4 items
  - › Level  $i$ :  $k - i$  steps for  $2^{i-1}$  items

$$\begin{aligned}\text{Total Steps} &= \sum_{i=1}^{k-1} (k - i) 2^{i-1} = 2^k - k - 1 \\ &= O(N)\end{aligned}$$

Binary Heaps - Lecture 11

31

## Other Heap Operations

- Find(X, H): Find the element X in heap H of N elements
  - › What is the running time?  $O(N)$
- FindMax(H): Find the maximum element in H
  - › What is the running time?  $O(N)$
- We sacrificed performance of these operations in order to get  $O(1)$  performance for FindMin

Binary Heaps - Lecture 11

32

## Other Heap Operations

- DecreaseKey(P,  $\Delta$ , H): Decrease the key value of node at position P by a positive amount  $\Delta$ . eg, to increase priority
  - › First, subtract  $\Delta$  from current value at P
  - › Heap order property may be violated
  - › so percolate up to fix
  - › Running Time:  $O(\log N)$

Binary Heaps - Lecture 11

33

## Other Heap Operations

- IncreaseKey(P,  $\Delta$ , H): Increase the key value of node at position P by a positive amount  $\Delta$ . eg, to decrease priority
  - › First, add  $\Delta$  to current value at P
  - › Heap order property may be violated
  - › so percolate down to fix
  - › Running Time:  $O(\log N)$

Binary Heaps - Lecture 11

34

## Other Heap Operations

- Delete(P, H): E.g. Delete a job waiting in queue that has been preemptively terminated by user
  - › Use DecreaseKey(P,  $\infty$ , H) followed by DeleteMin
  - › Running Time:  $O(\log N)$

Binary Heaps - Lecture 11

35

## Other Heap Operations

- Merge(H1, H2): Merge two heaps H1 and H2 of size  $O(N)$ . H1 and H2 are stored in two arrays.
  - › Can do  $O(N)$  Insert operations:  $O(N \log N)$  time
  - › Better: Copy H2 at the end of H1 and use BuildHeap. Running Time:  $O(N)$

Binary Heaps - Lecture 11

36

## PercUp Solution

---

```
PercUp(i : integer, x : integer): {  
  if i = 1 then A[i] := x  
  else if A[i/2] < x then  
    A[i] := x;  
  else  
    A[i] := A[i/2];  
    Percup(i/2,x);  
}
```
