

CSE 326: Data Structures

Spanning Trees

Brian Curless
Spring 2008

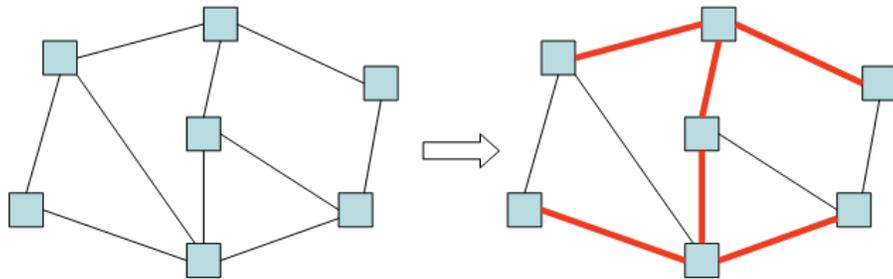

1

A Hidden Tree

2

Spanning Tree in a Graph

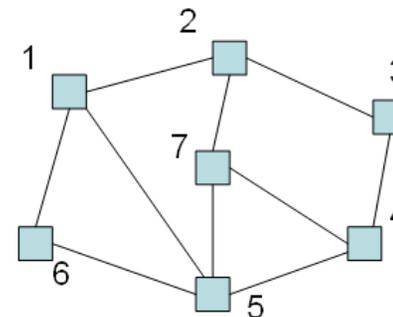

Vertex = router
Edge = link between routers

Spanning tree
- Connects all the vertices
- No cycles

3

Undirected Graph

- $G = (V, E)$
 - V is a set of vertices (or nodes)
 - E is a set of unordered pairs of vertices

$V = \{1,2,3,4,5,6,7\}$
 $E = \{(1,2), (1,6), (1,5), (2,7), (2,3), (3,4), (4,7), (4,5), (5,6)\}$

2 and 3 are adjacent
2 is incident to edge (2,3)

4

Spanning Tree Problem

- Input: An undirected graph $G = (V, E)$. G is connected.
- Output: T contained in E such that
 - (V, T) is a connected graph
 - (V, T) has no cycles

$\Rightarrow (V, T)$ is a tree

Spanning Tree Algorithm

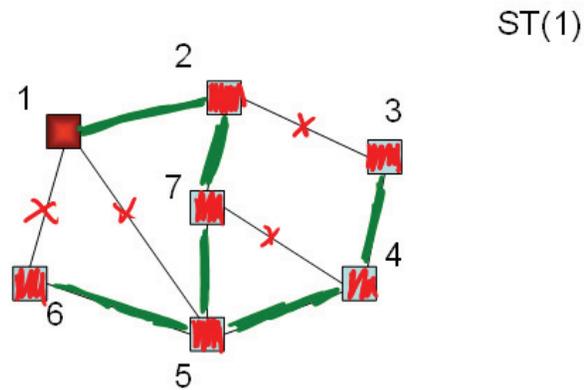

```

ST(Vertex i) {
  mark i;
  for each j adjacent to i {
    if (j is unmarked) {
      Add (i,j) to T;
      ST(j);
    }
  }
}
    
```

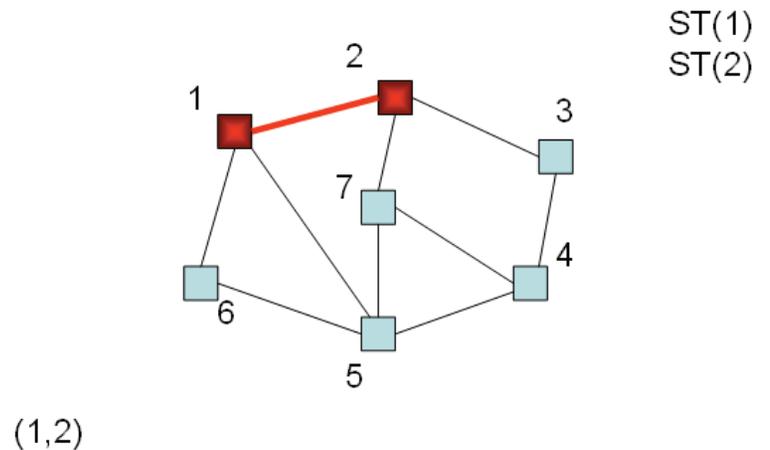

```

Main() {
  T = empty set;
  ST(1);
}
    
```

22

How many edges in a spanning tree?

Before moving on, it will help us to know how many edges a spanning tree must have.

First, a couple of properties of trees...

23

A tree has ^{at least} one vertex of degree one

Property: a tree with $|V| > 1$ has at least one vertex of degree one (i.e., with only one edge incident to it).

Proof by contradiction:

- Assume a “tree” with no such vertex.
- The graph has no endpoints and must contain a cycle.
- The graph is not a tree.

24

Removing a vertex of degree one gives a tree

Property: removing a vertex of degree one and the corresponding edge from a tree results in a tree.

Proof:

- Removing an edge cannot introduce cycles.
- Removing a vertex of degree one will not result in a disconnected graph.

So, the graph is acyclic and connected, i.e., a tree.

25

A spanning tree has $|V|-1$ edges

Property: a spanning tree over a graph with $|V|$ vertices has $|V|-1$ edges.

Proof by induction:

- Base case: 1 vertex $\rightarrow |V|-1 = 0$ edges.
- Inductive hypothesis: a spanning tree with $k-1$ vertices has $k-2$ edges.
- Inductive step: spanning tree with k vertices has $k-1$ edges.

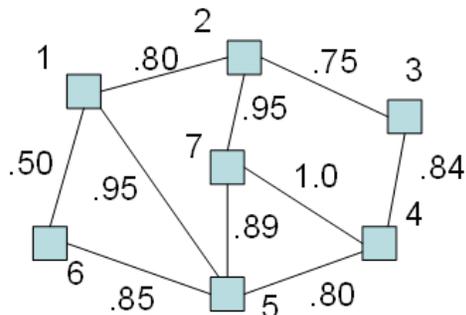

We must prove the inductive step:

- Spanning tree with k vertices has at least one vertex of degree 1.
- Remove that vertex and its edge from the graph and the spanning tree.
- The result is a spanning tree of $k-1$ vertices, which must have $k-2$ edges (inductive hypothesis).
- Restoring that vertex and edge gives a tree with k vertices and $k-1$ edges.

26

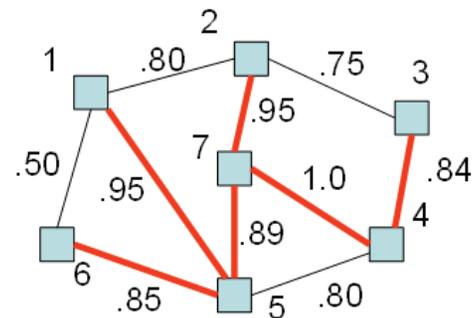

Best Spanning Tree

- Each edge has the probability that it won't fail
- Find the spanning tree that is least likely to fail

27

Example of a Spanning Tree

$$\begin{aligned} \text{Probability of success} &= .85 \times .95 \times .89 \times .95 \times 1.0 \times .84 \\ &= .5735 \end{aligned}$$

28

Minimum Spanning Trees

Given an undirected graph $G=(V,E)$, find a graph $G'=(V, E')$ such that:

- E' is a subset of E
- $|E'| = |V| - 1$
- G' is connected
- $\sum_{(u,v) \in E'} c_{uv}$ is minimal

G' is a **minimum spanning tree**.

Applications: wiring a house, power grids, Internet connections

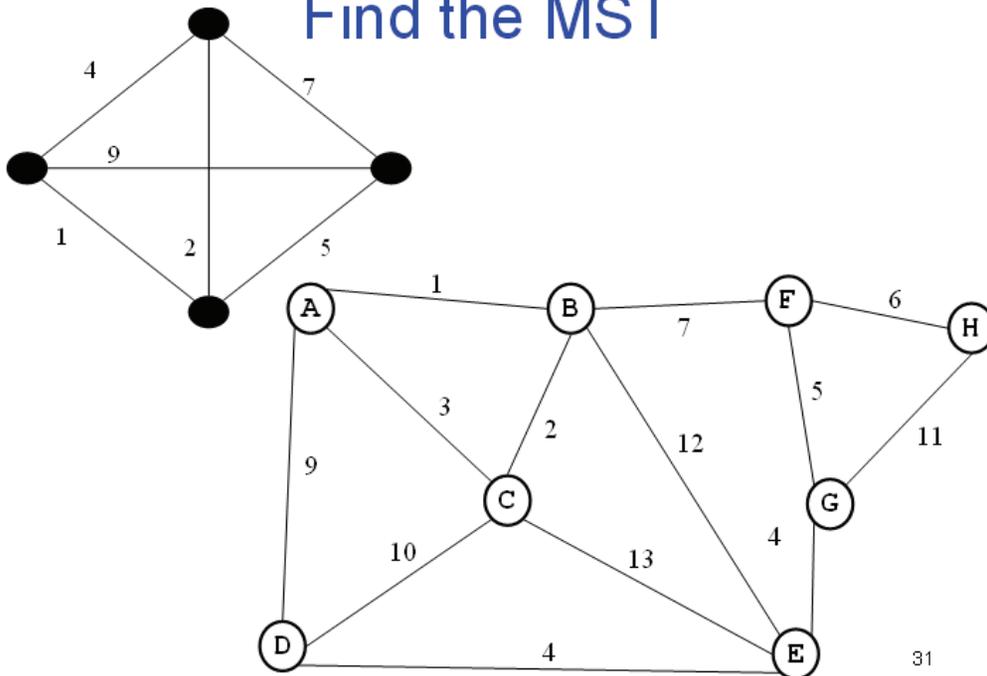

Minimum Spanning Tree Problem

- Input: Undirected Graph $G = (V,E)$ and a cost function C from E to the reals. $C(e)$ is the cost of edge e .
- Output: A spanning tree T with minimum total cost. That is: T that minimizes

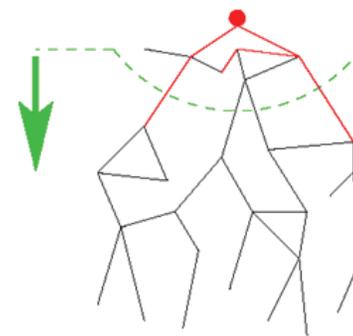

$$C(T) = \sum_{e \in T} C(e)$$

Your Turn

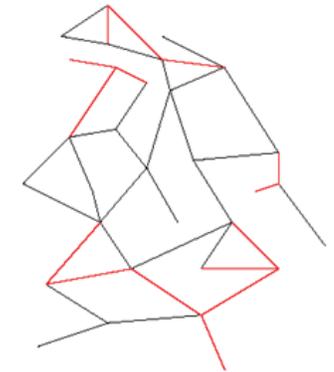

Find the MST

Two Different Approaches

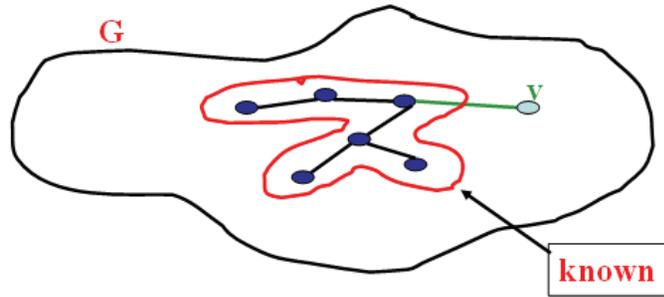

Prim's Algorithm
Almost identical to Dijkstra's

Kruskal's Algorithm
Completely different!

Prim's algorithm

Idea: Grow a tree by adding an edge from the "known" vertices to the "unknown" vertices. Pick the edge with the smallest weight.

Prim's Algorithm for MST

A **node-based greedy algorithm**
Builds MST by greedily adding nodes

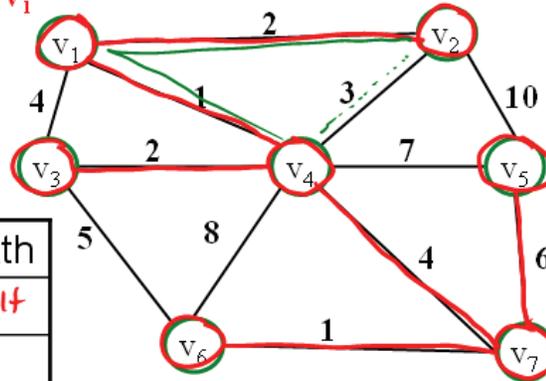

1. Select a node to be the "root"
 - mark it as known
 - Update cost of all its neighbors
2. While there are unknown nodes left in the graph
 - a. Select an unknown node b with the smallest cost from some *known* node a
 - b. Mark b as known
 - c. Add (a, b) to MST
 - d. Update cost of all nodes adjacent to b

Your Turn

Start with V_1

Find MST using Prim's

V	Kwn	Distance	path
v1	T	0	self
v2	T	2	v1
v3	T	4	v1 v4
v4	T	1	v1
v5	T	7	v1 v7
v6	T	5	v1 v3 v6
v7	T	4	v1 v4

Order Declared Known:

V_1

V_2

Prim's Algorithm Analysis

Running time:

Same as Dijkstra's: $O(|E| \log |V| + |V| \log |V|)$

Can we reduce this? $|E| \geq |V| - 1$
 $O(|E| \log |V|)$

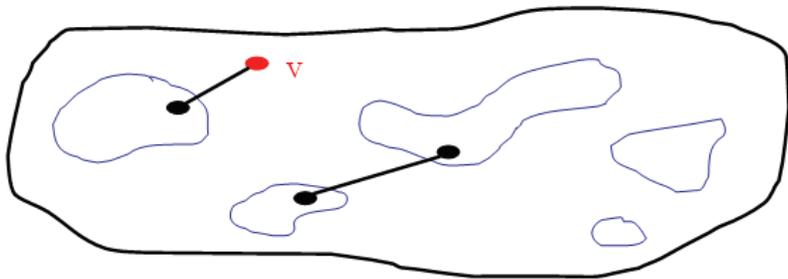

Correctness:

Proof is similar to Dijkstra's

Kruskal's MST Algorithm

Idea: Grow a **forest** out of edges that do not create a cycle. Pick an edge with the smallest weight.

$G=(V,E)$

37

Kruskal's Algorithm for MST

An edge-based greedy algorithm
Builds MST by greedily adding edges

1. Initialize with
 - empty MST
 - all vertices marked unconnected
 - all edges unmarked
2. While there are still unmarked edges
 - a. Pick the lowest cost edge (u,v) and mark it
 - b. If u and v are not already connected, add (u,v) to the MST and mark u and v as connected to each other

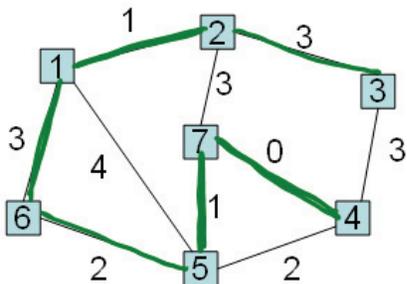

Doesn't it sound familiar? Maze problem... but not random edge sel.

Example of Kruskal 1

Edge w Status

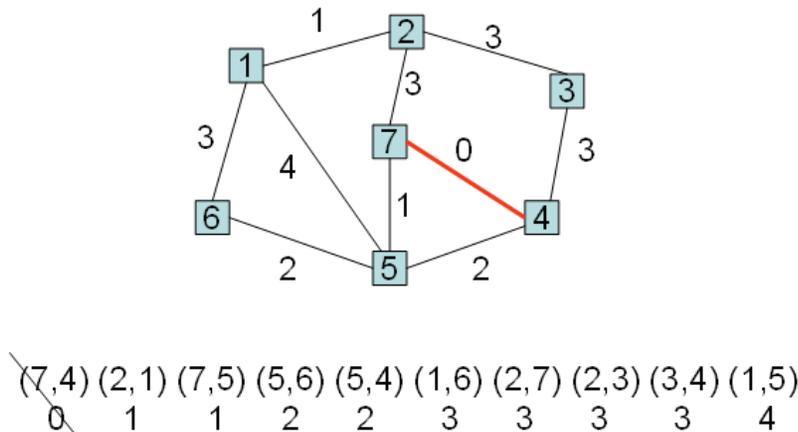

Edge	w	Status
(7,4)	0	A
(2,1)	1	A
(7,5)	1	A
(5,6)	2	A
(5,4)	2	R
(1,6)	3	A
(2,7)	3	R
(2,3)	3	A

(7,4)	(2,1)	(7,5)	(5,6)	(5,4)	(1,6)	(2,7)	(2,3)	(3,4)	(1,5)
0	1	1	2	2	3	3	3	3	4

39

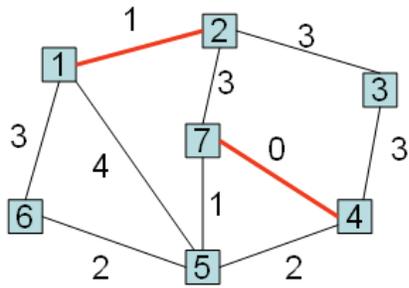

Example of Kruskal 2

(7,4)	(2,1)	(7,5)	(5,6)	(5,4)	(1,6)	(2,7)	(2,3)	(3,4)	(1,5)
0	1	1	2	2	3	3	3	3	4

40

~~(7,4)~~ ~~(2,1)~~ ~~(7,5)~~ ~~(5,6)~~ ~~(5,4)~~ ~~(1,6)~~ ~~(2,7)~~ ~~(2,3)~~ ~~(3,4)~~ ~~(1,5)~~
~~0~~ ~~1~~ ~~1~~ ~~2~~ ~~2~~ ~~3~~ ~~3~~ ~~3~~ ~~3~~ ~~4~~

Example of Kruskal 8,9

~~(7,4)~~ ~~(2,1)~~ ~~(7,5)~~ ~~(5,6)~~ ~~(5,4)~~ ~~(1,6)~~ ~~(2,7)~~ ~~(2,3)~~ ~~(3,4)~~ ~~(1,5)~~
~~0~~ ~~1~~ ~~1~~ ~~2~~ ~~2~~ ~~3~~ ~~3~~ ~~3~~ ~~3~~ ~~4~~

Data Structures for Kruskal

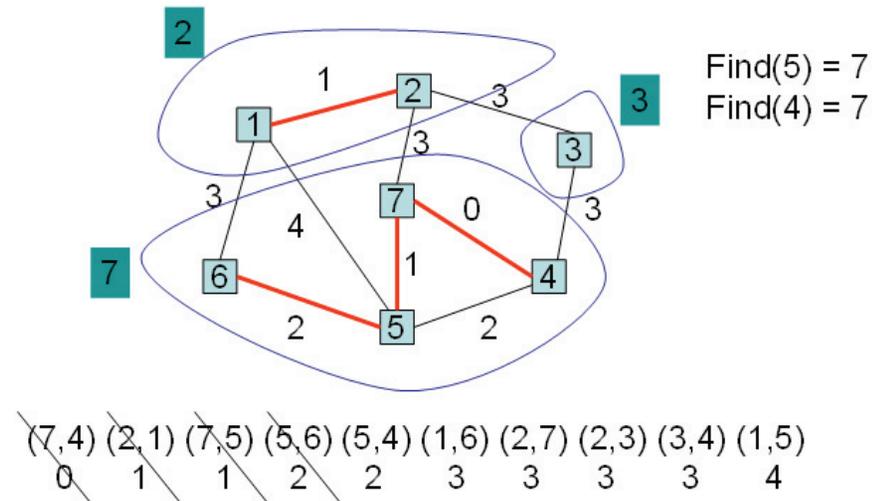

- Sorted edge list

(7,4) (2,1) (7,5) (5,6) (5,4) (1,6) (2,7) (2,3) (3,4) (1,5)
 0 1 1 2 2 3 3 3 3 4

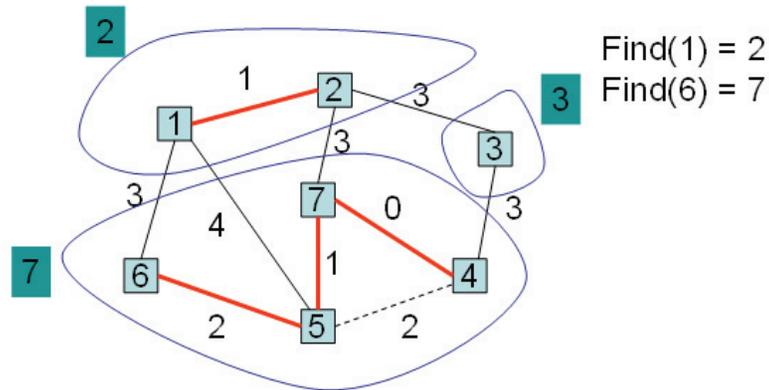

- Disjoint Union / Find

- Union(a,b) - union the disjoint sets named by a and b
- Find(a) returns the name of the set containing a

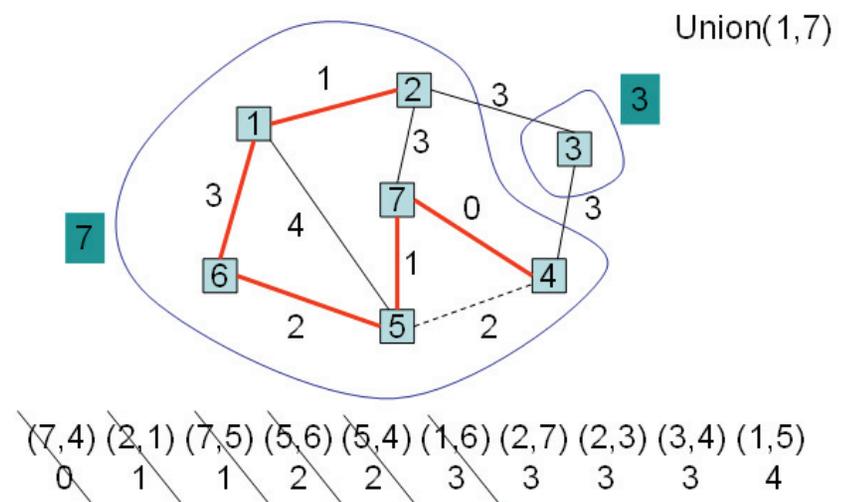

Example of DU/F 1

Example of DU/F 2

Example of DU/F 3

Kruskal's Algorithm with DU / F

Sort the edges by increasing cost; $|E| \log |E|$
 Initialize A to be empty;
 for each edge (i,j) chosen in increasing order do
 u := Find(i);
 v := Find(j);
 if not(u = v) then
 add (i,j) to A;
 Union(u,v);

iterates

This algorithm will work, but it goes through all the edges.

Is this always necessary?

Kruskal code

```
void Graph::kruskal(){
  int edgesAccepted = 0;
  DisjSet s(NUM_VERTICES);
  buildHeap(edge set);
  while (edgesAccepted < NUM_VERTICES - 1){
    e = smallest weight edge not deleted yet;
    // edge e = (u, v)
    uset = s.find(u);
    vset = s.find(v);
    if (uset != vset){
      edgesAccepted++;
      s.unionSets(uset, vset);
    }
  }
}
```

$O(|E|)$ buildHeap(edge set)
 $|E|$ heap ops
 $O(|E| \log |E|)$ smallest weight edge not deleted yet
 $2|E|$ finds
 $O(|E| \log |V|)$
 $O(|E| \log |V|)$
 $O(|E| \alpha(2|E|, |V|))$
 $O(|E| \log |E|)$ we know $|V| < |E| < |V|^2$
 $\Rightarrow O(|E| \log |V|^2) \Rightarrow O(|E| \log |V|)$
 $|V|$ unions $\sim O(|V|)$
 Total Cost: $O(|E| + |E| \log |E| + |E| \alpha(2|E|, |V|) + |V|)$

Kruskal's Algorithm: Correctness

It clearly generates a spanning tree. Call it T_K .

Suppose T_K is *not* minimum:

Pick another spanning tree T_{min} with *lower cost* than T_K

Pick the smallest edge $e_1=(u,v)$ in T_K that is not in T_{min}

T_{min} already has a path p in T_{min} from u to v

\Rightarrow Adding e_1 to T_{min} will create a cycle in T_{min}

Pick an edge e_2 in p that Kruskal's algorithm considered *after* adding e_1 (must exist: u and v unconnected when e_1 considered)

$\Rightarrow \text{cost}(e_2) \geq \text{cost}(e_1)$

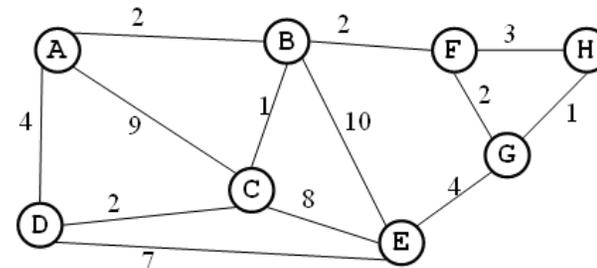

\Rightarrow can replace e_2 with e_1 in T_{min} without increasing cost!

Keep doing this until T_{min} is identical to T_K

$\Rightarrow T_K$ must also be minimal – contradiction!

Your Turn

Find MST using Prim's and Kruskal's

Reducing Best to Minimum

Let $P(e)$ be the probability that an edge doesn't fail.
Define:

$$C(e) = -\log_{10}(P(e))$$

Minimizing $\sum_{e \in T} C(e)$

is equivalent to maximizing $\prod_{e \in T} P(e)$

because $\prod_{e \in T} P(e) = \prod_{e \in T} 10^{-C(e)} = 10^{-\sum_{e \in T} C(e)}$
