

Announcements

- Written HW #1 due NOW
- Written HW #2 out today, due next Friday
- Project #2 Part A out now
 - Can work in pairs; start figuring out who you'd like to work with or whether you want to go alone
 - Report your choice by next Wednesday
 - Part A due the following Wednesday

1/18/2008

New Heap Operation: Merge

Given two heaps, merge them into one heap

 first attempt: insert each element of the smaller heap into the larger.

runtime:

 second attempt: concatenate binary heaps' arrays and run buildHeap.
runtime:

runti

4

Leftist Heaps

Idea:

Focus all heap maintenance work in one small part of the heap

Leftist heaps:

- 1. Most nodes are on the left
- 2. All the merging work is done on the right

Leftist Heap Properties

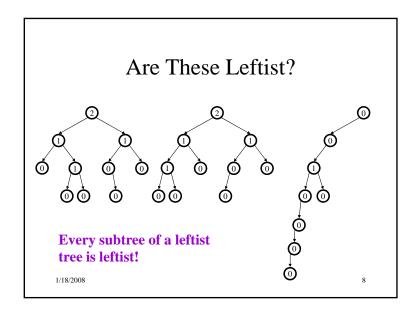

- Heap-order property
 - parent's priority value is \leq to childrens' priority values
 - result: minimum element is at the root
- Leftist property

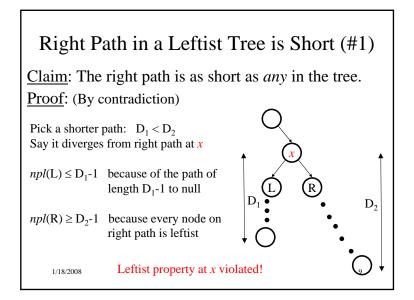

1/18/2008

- For every node *x*, $npl(left(x)) \ge npl(right(x))$
- <u>result</u>: tree is at least as "heavy" on the left as the right

Are leftist trees... complete? balanced?

Right Path in a Leftist Tree is Short (#2) Claim: If the right path has **r** nodes, then the tree has at least 2^r-1 nodes. Proof: (By induction) **Base case** : r=1. Tree has at least $2^{1}-1 = 1$ node **Inductive step** : assume true for **r**' < **r**. Prove for tree with right path at least **r**. 1. Right subtree: right path of **r-1** nodes \Rightarrow 2^{r-1}-1 right subtree nodes (by induction)</sup> 2. Left subtree: also right path of length at least **r-1** (by previous slide) \Rightarrow 2^{r-1}-1 left subtree nodes (by induction)</sup> Total tree size: $(2^{r-1}-1) + (2^{r-1}-1) + 1 = 2^{r}-1$ 1/18/2008 10

Why do we have the leftist property?Because it guarantees that:the *right path is really short* compared to the number of nodes in the tree

• A leftist tree of N nodes, has a right path of at most log (N+1) nodes

Idea – perform all work on the right path

1/18/2008

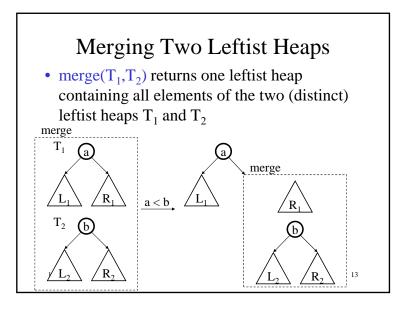

11

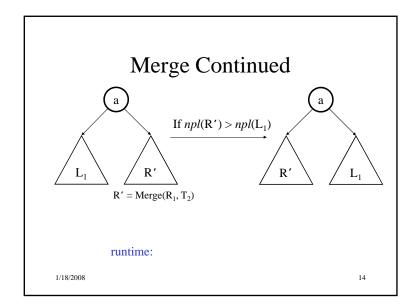

Merge two heaps (basic idea)

- Put the smaller root as the new root,
- Hang its left subtree on the left.
- <u>Recursively</u> merge its right subtree and the other tree.

Random Definition: Amortized Time

am·or·tized time:

Running time limit resulting from "writing off" expensive runs of an algorithm over multiple cheap runs of the algorithm, usually resulting in a lower <u>overall</u> running time than indicated by the worst possible case.

21

If M operations take total O(M log N) time, *amortized* time per operation is O(log N)

Difference from average time:
