

Trees

(Splay Trees)

Chapter 4 in Weiss

CSE 326
Data Structures
Ruth Anderson

1/29/2010

1

Today's Outline

- **Announcements**
 - Written HW #3 due NOW
 - Project 2A due Monday, 2/1
 - Midterm, next Friday 2/5
- **Today's Topics:**
 - Dictionary ADT
 - AVL Trees
 - Splay Trees

1/29/2010

2

Other Possibilities?

- Could use different balance conditions, different ways to maintain balance, different guarantees on running time, ...
- Why aren't AVL trees perfect?
- Many other balanced BST data structures
 - Red-Black trees
 - AA trees
 - Splay Trees
 - 2-3 Trees
 - B-Trees

1/29/2010

3

Splay Trees

- Blind adjusting version of AVL trees
 - Why worry about balances? Just rotate anyway!
- *Amortized time* per operations is $O(\log n)$
- Worst case time per operation is $O(n)$
 - But guaranteed to happen rarely

Insert/Find always rotate node to the root!

SAT/GRE Analogy question:

AVL is to Splay trees as _____ is to _____

1/29/2010

4

Recall: Amortized Complexity

If a sequence of M operations takes $O(M f(n))$ time, we say the amortized runtime is $O(f(n))$.

- Worst case time *per operation* can still be large, say $O(n)$
- Worst case time for *any* sequence of M operations is $O(M f(n))$

Average time *per operation* for any sequence is $O(f(n))$

Amortized complexity is *worst-case* guarantee over *sequences* of operations.

1/29/2010

5

Recall: Amortized Complexity

- Is amortized guarantee any weaker than worstcase?
- Is amortized guarantee any stronger than averagecase?
- Is average case guarantee good enough in practice?
- Is amortized guarantee good enough in practice?

1/29/2010

6

The Splay Tree Idea

If you're forced to make a really deep access:

Since you're down there anyway, fix up a lot of deep nodes!

1/29/2010 7

Find/Insert in Splay Trees

1. Find or insert a node k
2. Splay k to the root using: zig-zag, zig-zig, or plain old zig rotation

Why could this be good??

1. Helps the new root, k
 - o Great if k is accessed again
2. And helps many others!
 - o Great if many others on the path are accessed

1/29/2010 8

Splaying node k to the root: Need to be careful!

One option (that we won't use) is to repeatedly use AVL single rotation until k becomes the root: (see Section 4.5.1 for details)

What's bad about this process?

1/29/2010 9

Splay: Zig-Zag*

*Just like an... Which nodes improve depth?

1/29/2010 10

Splay: Zig-Zig*

*Is this just two AVL single rotations in a row?

1/29/2010 11

Special Case for Root: Zig

Relative depth of p, Y, Z ? Relative depth of everyone else?

Why not drop zig-zig and just zig all the way?

1/29/2010 12

Insert 6, 5, 4, 3, 2, 1

- Cost of each insert? $O(\quad)$

Activity

Original Tree

1/29/2010

19

Tree after two finds

But Wait...

What happened here?

Didn't *two* find operations take linear time instead of logarithmic?

What about the amortized $O(\log n)$ guarantee?

1/29/2010

20

Why Splaying Helps

- If a node n on the access path is at depth d before the splay, it's at about depth $d/2$ after the splay
- Overall, nodes which are low on the access path tend to move closer to the root
- Splaying gets amortized $O(\log n)$ performance. (Maybe not now, but soon, and for the rest of the operations.)

1/29/2010

21

Practical Benefit of Splaying

- No heights to maintain, no imbalance to check for
 - Less storage per node, easier to code
- Often data that is accessed once, is soon accessed again!
 - Splaying does implicit *caching* by bringing it to the root
- Often related data is accessed in sequence
 - Helps node AND its children

1/29/2010

22

Splay Operations: Find

- Find the node in normal BST manner
- Splay the node to the root
 - if node not found, splay what would have been its parent

What if we didn't splay?

1/29/2010

23

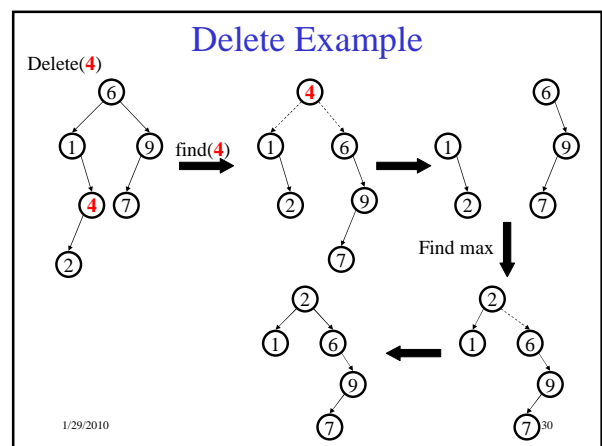

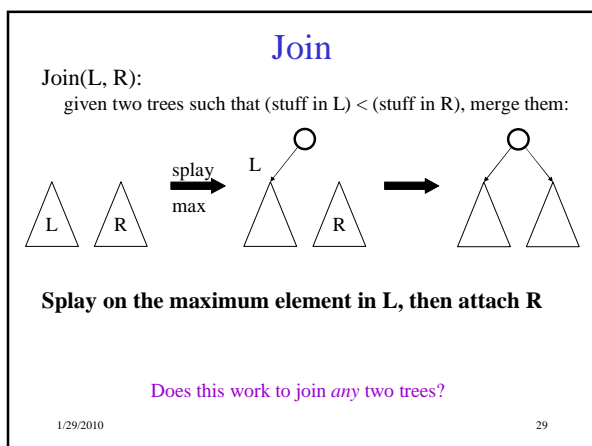

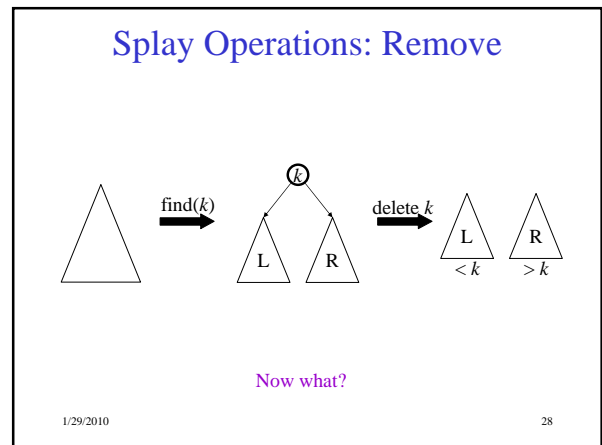

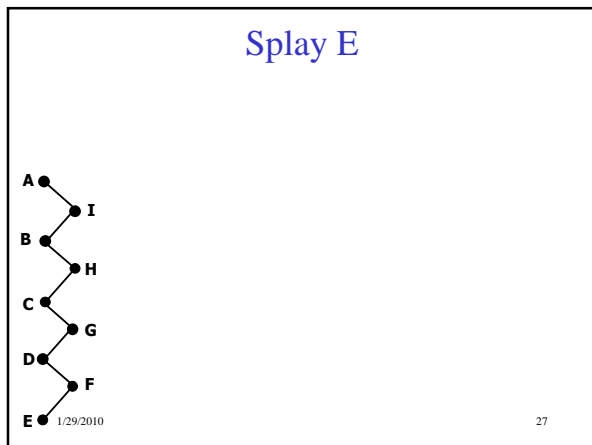

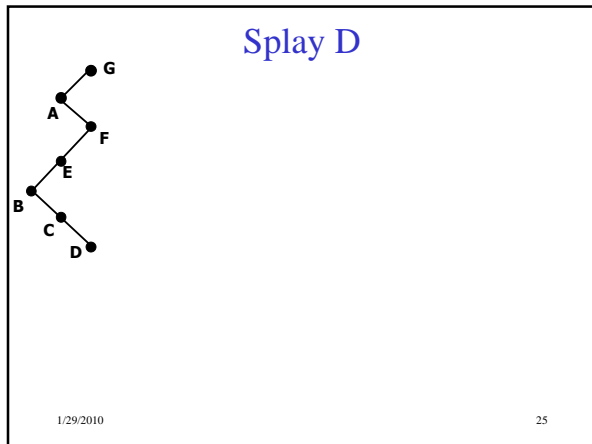

Splay Operations: Insert

- Insert the node in normal BST manner
- Splay the node to the root

What if we didn't splay?

1/29/2010

24

Splay Tree Summary

- All operations are in amortized $O(\log n)$ time
- Splaying can be done top-down; this may be better because:
 - only one pass
 - no recursion or parent pointers necessary
 - *we didn't cover top-down in class*
- Splay trees are *very* effective search trees
 - Relatively simple
 - No extra fields required
 - **Excellent *locality* properties:** frequently accessed keys are cheap to find
