

# Hard Problems

# Familiar Problems

Sorting:  $n \log(n)$

Shortest Path:  $|E| \log(|V|)$

All pairs shortest path:  $|V|^3$

Topological Sort:  $|E| + |V|$

Minimum Spanning Tree:  $|E| \log(|V|)$

Dictionary Operations:  $\log(n)$

...

# Familiar Problems

All of these are  $O(n^k)$

Question: Are all problems solvable in polynomial time?

# Computability

An simpler question:

Are all problems solvable?

Equivalently:

Can a computer compute the value of  $f(x)$  for any  $f$  and  $x$ ?

# Computability

An simpler question:

Are all problems solvable?

Equivalently:

Can a computer compute the value of  $f(x)$  for any  $f$  and  $x$ ?

Answer: No!

# The Halting Problem

Given a computer program  $F$ , write a program  $H$ , where,

$$h(f, x) = \begin{cases} 1 & \text{if } f(x) \text{ halts} \\ 0 & \text{if } f(x) \text{ runs forever} \end{cases}$$

This is impossible!

# The Halting Problem

Proof (by contradiction):

Suppose  $h(f,x)$  is computable.

First, enumerate every computer program:

$f_1$

$f_2$

$f_3$

$\vdots$

# The Halting Problem

Proof, continued:

Now define a function,

$$g(x) = \begin{cases} 0 & \text{if } f_x(x) \text{ loops forever} \\ \text{loop forever} & \text{if } f_x(x) \text{ halts} \end{cases}$$

Since we listed all computable function,  
for some  $k$ ,  $g = f_k$

# The Halting Problem

Proof, continued:

What happens when we call  $g$  on its own number?

$$g(k) = \begin{cases} 0 & \text{if } g(k) \text{ loops forever} \\ \text{loop forever} & \text{if } g(k) \text{ halts} \end{cases}$$

A Contradiction!

# Two Problems

## Hamiltonian Circuit

Given a graph  $G$ :

Find a path that goes through each vertex exactly once, and returns:

# Two Problems

## Eulerian Circuit

Given a graph  $G$ :

Find a path that goes through each edge exactly once, and returns:

# Two Complexity Classes

$P$  = The set of all problems solvable in polynomial time.

$NP$  = The set of all problems verifiable in polynomial time.

Note that  $P$  is a subset of  $NP$ .

# Two Complexity Classes

Eulerian Cycle is in NP.

Hamiltonian Cycle also is in NP.

Eulerian Cycle is in P.

Is Hamiltonian Cycle in P?

# Two Complexity Classes

Eulerian Cycle in NP.

Hamiltonian Cycle also is in NP.

Eulerian Cycle in P.

Is Hamiltonian Cycle in P?

**No one knows!**

$$P \stackrel{?}{=} NP$$

Is there any problem in NP that's not in P?

Not currently known!

Huge practical consequences:

circuit board layout,  
protein folding,  
flight schedules,  
etc.

(Also, a \$1 million prize.)

# P $\neq$ NP

Suppose we want to show P  $\neq$  NP.

Find any problem in NP that's definitely not in P.

Similar to comparison sort taking at least  $n \log(n)$  comparisons.

Find a problem in NP that takes at least,

$$2^n, n!, \binom{n}{k}, \dots$$

$$P = NP$$

Suppose we want to show  $P=NP$ .

Find the hardest problem in NP, and show that it's in P.

Ok, so what's the hardest problem in NP?

# Two More Complexity Classes

NP-Hard =

problems at least as hard as anything in NP.

NP-Complete =

problems in both NP-Hard and NP

We just need to show one problem in NP-Complete is also in P!

# NP-Complete

Hamiltonian Cycle in NP-Complete.

Thousands of others are too:

Longest Path

Boolean Satisfiability

Traveling Salesman

Set Covering

Graph Coloring

...

# Traveling Salesman

Given set of  $n$  cities, and distances between the cities, find the shortest cycle visiting each city exactly once.

This is just Hamiltonian Cycle, but with edge weights.

# Longest Path

Problem:

Given a graph, find the longest path between any two vertices.

Longest Path is NP-Complete.

But Shortest Path is in P!

# 15-Puzzle

Find the fewest number of moves needed to solve the k-Puzzle.

Pretty good solutions using Best First Search with a Manhattan Distance heuristic.

# Minesweeper

Is a certain assignment of flags consistent with the adjacent numbers.

Easy in practice, but not easy in general.

# SAT

Given a set of Boolean variables, can we assign true/false values to them to make an arbitrary formula true?

For example, give the formula:

$$(\neg x_1 \vee x_2) \wedge (x_1 \vee x_3) \vee \neg(x_2 \vee \neg x_4) \wedge \neg x_3$$

Can we assign values to the  $x$ 's to make this true?

# 3SAT

Let's make things easier:

Every formula takes the same form:

$$(\neg x_1 \vee x_2 \vee x_4) \wedge (x_1 \vee \neg x_3 \vee x_4) \wedge (x_2 \vee \neg x_4 \vee \neg x_5)$$

Formula:

and number of clauses separated by OR

Clause:

three terms separated by AND

Term:

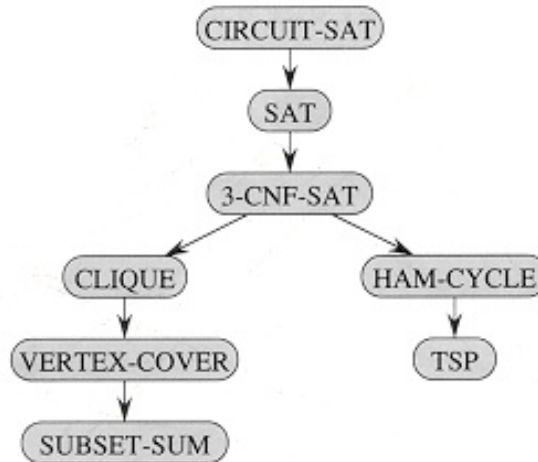

either  $x_i$  or

3SAT is NP-Complete, 2SAT is P.

# Proving NP-Completeness

Show a reduction from some known NP-Complete problem.

"If we can solve Hamiltonian Cycle we can solve 3SAT. "

# Practical Concerns

Moral of the story:

Don't waste time trying to write a clever program to solve a NP-complete problem.

Look for a good approximation or heuristic.
