Design Patterns Part 2

(Slides by Mike Ernst and David Notkin)

Outline

- ✓ Introduction to design patterns
- ✓ Creational patterns (constructing objects)
- ⇒ Structural patterns (controlling heap layout)
- Behavioral patterns (affecting object semantics)

Structural patterns: Wrappers

- A wrapper translates between incompatible interfaces
- Wrappers are a thin veneer over an encapsulated class
 - modify the interface
 - extend behavior
 - restrict access
- The encapsulated class does most of the work

Pattern	Functionality	Interface
Adapter	same	different
Decorator	different	same
Proxy	same	same

Adapter

- Change an interface without changing functionality
 - rename a method
 - convert units
 - implement a method in terms of another
- Example: angles passed in radians vs. degrees

Adapter example: scaling rectangles

 We have this Rectangle interface interface Rectangle {

```
// grow or shrink this by the given factor
void scale(float factor);
...
float getWidth();
float area();
}
```

• Goal: we want to use instances of this class to "implement" Rectangle:

```
class NonScaleableRectangle { // not a Rectangle
  void setWidth(float width) { ... }
  void setHeight(float height) { ... }
  // no scale method
  ...
}
```

Adaptor: Use subclassing

Adaptor: use delegation

Delegation: forward requests to another object

```
class ScaleableRectangle2 implements Rectangle {
  NonScaleableRectangle r;
  ScaleableRectangle2(w,h) {
    this.r = new NonScaleableRectangle(w,h);
  }

  void scale(float factor) {
    setWidth(factor * r.getWidth());
    setHeight(factor * r.getHeight());
  }

  float getWidth() { return r.getWidth(); }
  float circumference() { return r.circumference(); }
  ...
}
```

Subclassing vs. delegation

- Subclassing
 - automatically gives access to all methods of superclass
 - built into the language (syntax, efficiency)
- Delegation
 - permits cleaner removal of methods (compile-time checking)
 - wrappers can be added and removed dynamically
 - objects of arbitrary concrete classes can be wrapped
 - multiple wrappers can be composed
- Some wrappers have qualities of more than one of adapter, decorator, and proxy
- Delegation vs. composition
 - Differences are subtle
 - For CSE 331, consider them to be equivalent

Decorator

- Add functionality without changing the interface
- Add to existing methods to do something additional (while still preserving the previous specification)
- Not all subclassing is decoration

Decorator example: Bordered windows

```
interface Window {
    // rectangle bounding the window
    Rectangle bounds();
    // draw this on the specified screen
    void draw(Screen s);
    ...
}
class WindowImpl implements Window {
    ...
}
```

Bordered window implementations

```
Via subclasssing:
   class BorderedWindow1 extends WindowImpl {
     void draw(Screen s) {
       super.draw(s);
       bounds().draw(s);
Via delegation:
   class BorderedWindow2 implements Window {
     Window innerWindow:
     BorderedWindow2 (Window innerWindow) {
       this.innerWindow = innerWindow;
     void draw(Screen s) {
       innerWindow.draw(s);
       innerWindow.bounds().draw(s);
```

Delegation permits multiple borders on a window, or a window that is both bordered and shaded (or either one of those)

A decorator can remove functionality

- Remove functionality without changing the interface
- Example: UnmodifiableList
 - What does it do about methods like add and put?

Proxy

- Same interface and functionality as the wrapped class
- Control access to other objects
 - communication: manage network details when using a remote object
 - locking: serialize access by multiple clients
 - security: permit access only if proper credentials
 - creation: object might not yet exist (creation is expensive)
 - hide latency when creating object
 - avoid work if object is never used
