

Warmup

A programmer's roommate tells him, "Would you mind going to the store and picking up a loaf of bread. Also, if they have eggs, get a dozen."

The programmer returns with 12
loaves of bread.

Section 3:

HW4, ADTs, and more

WITH MATERIAL FROM VINOD

Agenda

Announcements

- HW3: due tonight at 11pm

Polynomial arithmetic

Abstract data types (ADT)

Representation invariants (RI)

Abstraction Functions

HW4: Polynomial Graphing Calculator

Problem 0: Write pseudocode algorithms for polynomial operations

Problem 1: Answer questions about RatNum

Problem 2: Implement RatTerm

Problem 3: Implement RatPoly

Problem 4: Implement RatPolyStack

Problem 5: Try out the calculator

RatThings

RatNum

- ADT for a Rational Number
- Has NaN

RatTerm

- Single polynomial term
- Coefficient (RatNum) & degree

RatPoly

- Sum of RatTerms

RatPolyStack

- Ordered collection of RatPolys

Polynomial Addition

$$(5x^4 + 4x^3 - x^2 + 5) + (3x^5 - 2x^3 + x - 5)$$

Polynomial Addition

$$(5x^4 + 4x^3 - x^2 + 5) + (3x^5 - 2x^3 + x - 5)$$

$$\begin{array}{r} 5x^4 + 4x^3 - x^2 \quad \quad \quad + 5 \\ + \quad 3x^5 \quad \quad \quad - \quad 2x^3 \quad \quad + \quad x \quad - \quad 5 \end{array}$$

Polynomial Addition

$$(5x^4 + 4x^3 - x^2 + 5) + (3x^5 - 2x^3 + x - 5)$$

$$\begin{array}{r} 5x^4 + 4x^3 - x^2 \quad 0x \quad + 5 \\ + \quad 3x^5 \quad 0x^4 \quad - \quad 2x^3 \quad 0x^2 \quad + \quad x \quad - 5 \end{array}$$

Polynomial Addition

$$(5x^4 + 4x^3 - x^2 + 5) + (3x^5 - 2x^3 + x - 5)$$

$$\begin{array}{r} 5x^4 + 4x^3 - x^2 \quad 0x \quad + 5 \\ + 3x^5 \quad 0x^4 - 2x^3 \quad 0x^2 + x \quad - 5 \\ \hline \end{array}$$

$$3x^5 + 5x^4 + 2x^3 - x^2 + x + 0$$

Polynomial Subtraction

$$(5x^4 + 4x^3 - x^2 + 5) - (3x^5 - 2x^3 + x - 5)$$

$$\begin{array}{r} 5x^4 + 4x^3 - x^2 \quad \quad \quad + 5 \\ - 3x^5 \quad \quad \quad - 2x^3 \quad \quad \quad + x \quad - 5 \end{array}$$

Polynomial Subtraction

$$(5x^4 + 4x^3 - x^2 + 5) - (3x^5 - 2x^3 + x - 5)$$

$$\begin{array}{r} 5x^4 + 4x^3 - x^2 \quad 0x \quad + 5 \\ - 3x^5 \quad 0x^4 \quad - 2x^3 \quad 0x^2 + x \quad - 5 \end{array}$$

Polynomial Subtraction

$$(5x^4 + 4x^3 - x^2 + 5) - (3x^5 - 2x^3 + x - 5)$$

$$\begin{array}{r} 5x^4 + 4x^3 - x^2 \quad 0x \quad + 5 \\ - 3x^5 \quad 0x^4 - 2x^3 \quad 0x^2 + x \quad - 5 \\ \hline -3x^5 + 5x^4 + 6x^3 - x^2 - x \quad + 10 \end{array}$$

Polynomial Multiplication

$$(4x^3 - x^2 + 5) * (x - 5)$$

Polynomial Multiplication

$$(4x^3 - x^2 + 5) * (x - 5)$$

$$4x^3 - x^2 + 5$$

*

$$x - 5$$

Polynomial Multiplication

$$(4x^3 - x^2 + 5) * (x - 5)$$

$$4x^3 - x^2 + 5$$

*

$$x - 5$$

$$\begin{array}{r} -20x^3 + 5x^2 \\ \hline \end{array} \quad \begin{array}{r} - 25 \\ \hline \end{array}$$

Polynomial Multiplication

$$(4x^3 - x^2 + 5) * (x - 5)$$

$$4x^3 - x^2 + 5$$

*

$$x - 5$$

$$\begin{array}{r} -20x^3 + 5x^2 \\ \hline \end{array}$$

$$\begin{array}{r} 4x^4 \\ -x^3 \\ \hline \end{array}$$

$$\begin{array}{r} + 5x \\ \hline \end{array}$$

$$\begin{array}{r} - 25 \\ \hline \end{array}$$

Polynomial Multiplication

$$(4x^3 - x^2 + 5) * (x - 5)$$

$$\begin{array}{r} 4x^3 - x^2 + 5 \\ \times \quad \quad \quad x - 5 \\ \hline -20x^3 + 5x^2 \quad \quad \quad - 25 \\ + \quad 4x^4 \quad \quad \quad -x^3 \quad \quad \quad + 5x \\ \hline 4x^4 \quad -21x^3 + 5x^2 + 5x - 25 \end{array}$$

Poly Division

$$(5x^6 + 4x^4 - x^3 + 5) \ / \ (x^3 - 2x - 5)$$

Poly Division

$$(5x^6 + 4x^4 - x^3 + 5) \ / \ (x^3 - 2x - 5)$$

$$x^3 - 2x - 5 \quad \boxed{5x^6 + 4x^4 - x^3 + 5}$$

Poly Division

$$5x^3 + 14x + 24$$

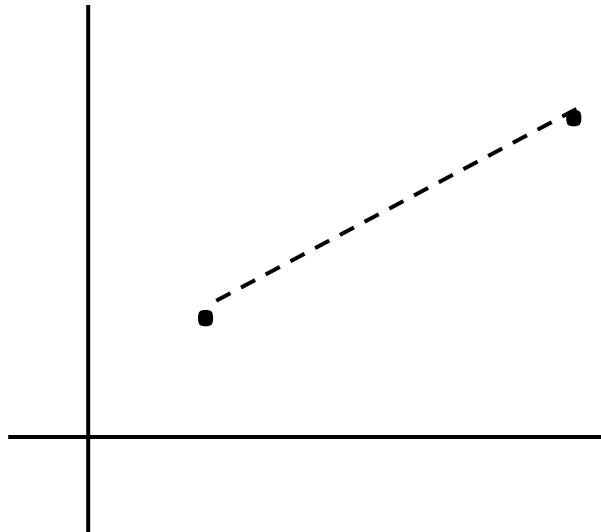

Poly Division

$$(5x^6 + 4x^4 - x^3 + 5) \ / \ (x^3 - 2x - 5)$$

$$\begin{array}{r} 28x^2 + 118x + 125 \\ \hline x^3 - 2x - 5 \\ \hline 5x^3 + 14x + 24 \end{array}$$

ADT Example: Line

Suppose we want to make a `Line` class that represents lines on the Cartesian plane

See

<http://courses.cs.washington.edu/courses/cse331/15sp/concepts/>

specifications.html

for more

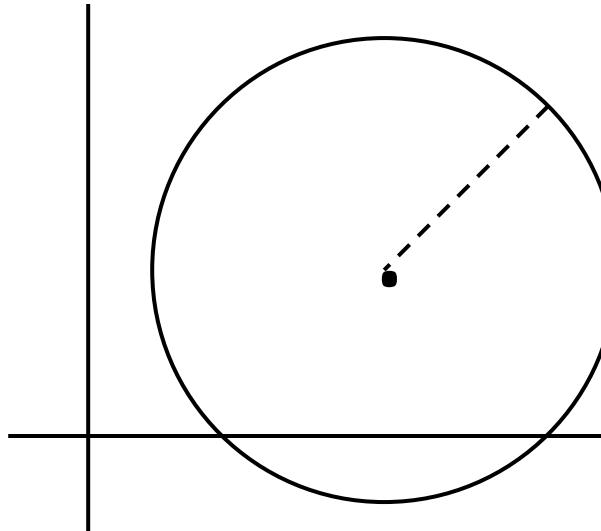

ADT Example: Line

```
/**  
 * This class represents the mathematical concept of a line segment.  
 *  
 * A line is an immutable line segment on the 2D plane that has  
 * endpoints p1  
 * and p2  
 */  
  
public class Line {  
  
    ...  
}  
  

```

ADT Example: Circle

Circle on the Cartesian coordinate plane

Circle: Class Specification

What represents the abstract state of a Circle?

What are some properties of a circle we can determine?

How can we implement this?

What are some ways to “break” a circle?

Representation Invariants

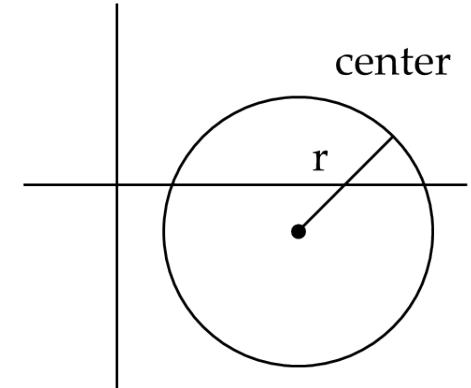

Constrains an object's internal state

Maps concrete representation of object to a boolean

If representation invariant is false/violated, the object is “broken” – doesn't map to any abstract value

Circle Implementation 1

```
public class Circle1 {  
    private Point center;  
    private double rad;  
  
    // Rep invariant:  
    //  
  
    // ...  
}
```

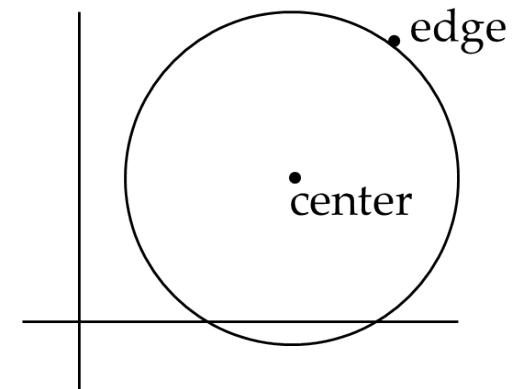

Circle Implementation 1

```
public class Circle1 {  
    private Point center;  
    private double rad;  
  
    // Rep invariant:  
    // center != null && rad > 0  
  
    // ...  
}
```

Circle Implementation 2

```
public class Circle2 {  
    private Point center;  
    private Point edge;  
  
    // Rep invariant:  
    //  
  
    //     ...  
}
```

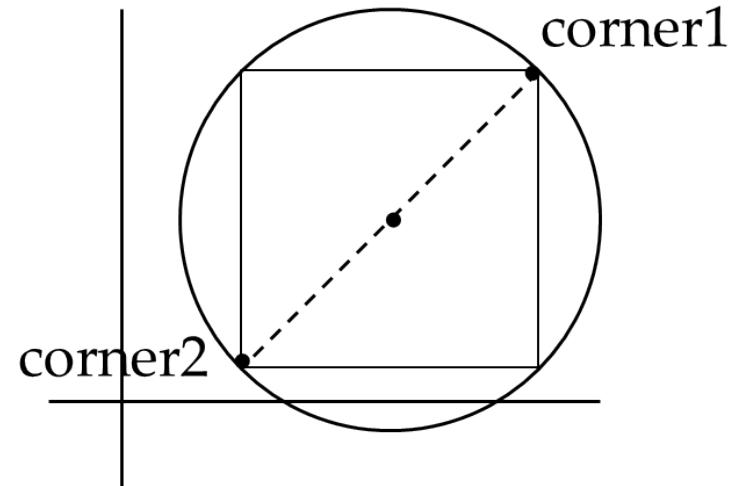

Circle Implementation 2

```
public class Circle2 {  
    private Point center;  
    private Point edge;  
  
    // Rep invariant:  
    // center != null &&  
    // edge != null &&  
    // !center.equals(edge)  
    // ...  
}
```

Circle Implementation 3

```
public class Circle3 {  
    private Point corner1, corner2;  
  
    // Rep invariant:  
    //  
    //      ...  
}
```

Circle Implementation 3

```
public class Circle3 {  
    private Point corner1, corner2;  
  
    // Rep invariant:  
    // corner1 != null &&  
    // corner2 != null &&  
    // !corner1.equals(corner2)  
    // ...  
}
```

Checking Rep Invariants

- Representation invariant should hold before and after every public method

Write and use `checkRep()`

- Call before and after public methods
- Make use of Java's assert syntax!
- OK that it adds extra code
 - Asserts won't be included on release builds
 - Important for finding bugs

checkRep() Example with Asserts

```
public class Circle1 {  
    private Point center;  
    private double rad;  
  
    private void checkRep() {  
        assert center != null : "This does not have a  
                               center";  
        assert radius > 0 : "This circle has a negative  
                           radius";  
    }  
}
```

A lot neater!

Using Asserts

To enable asserts: Go to Run->Run Configurations...->Arguments tab-> input

- ea** in VM arguments section
 - Do this for every test file
 - Demo!

Abstraction Function

Abstraction function: a **mapping** from **internal state** to **abstract value**

Abstract fields may not map directly to representation fields

- Circle has **radius** but not necessarily

```
private int radius;
```

Internal representation can be anything as long as it somehow encodes the abstract value

Representation Invariant excludes values for which the abstraction function has no meaning

Circle Implementation 1

```
public class Circle1 {  
    private Point center;  
    private double rad;  
  
    // Abstraction function:  
    // AF(this) = a circle c such that  
    //     c.center =  
    //     c.radius =  
  
    // Rep invariant:  
    // center != null && rad > 0  
  
    // ...  
}
```

Circle Implementation 1

```
public class Circle1 {  
    private Point center;  
    private double rad;  
  
    // Abstraction function:  
    // AF(this) = a circle c such that  
    //     c.center = this.center  
    //     c.radius = this.rad  
  
    // Rep invariant:  
    // center != null && rad > 0  
  
    // ...  
}
```

Circle Implementation 2

```
public class Circle2 {  
    private Point center;  
    private Point edge;  
  
    // Abstraction function:  
    // AF(this) = a circle c such that  
    //     c.center =  
    //     c.radius =  
  
    // Rep invariant:  
    // center != null && edge ! null &&  
    // !center.equals(edge)  
  
    // ...  
}
```

Circle Implementation 2

```
public class Circle2 {  
    private Point center;  
    private Point edge;  
  
    // Abstraction function:  
    // AF(this) = a circle c such that  
    //     c.center = this.center  
    //     c.radius = sqrt((center.x-edge.x)^2 +  
    //                     (center.y-edge.y)^2)  
  
    // Rep invariant:  
    // center != null && edge ! null &&  
    //     !center.equals(edge)  
    //     ...  
}
```

Circle Implementation 3

```
public class Circle3 {  
    private Point corner1, corner2;  
  
    // Abstraction function:  
    // AF(this) = a circle c such that  
    //     c.center =  
    //     c.radius =  
  
    // Rep invariant:  
    // corner1 != null && corner2 != null &&  
    // !corner1.equals(corner2)  
  
    // ...  
}
```

Circle Implementation 3

```
public class Circle3 {  
    private Point corner1, corner2;  
  
    // Abstraction function:  
    // AF(this) = a circle c such that  
    //     c.center = <(corner1.x + corner2.x) / 2,  
    //                 (corner1.y + corner2.y) / 2>  
  
    //     c.radius = (1/2)*sqrt((corner1.x-  
    //                           corner2.x)^2 + (corner1.y-  
    //                           corner2.y)^2)  
  
    // Rep invariant:  
    // corner1 != null && corner2 != null &&  
    // corner1.equals(corner2) !  
    // ...  
}
```

ADT Example: NonNullStringList

```
public class NonNullStringList {  
    // Abstraction function:  
    // ??  
  
    // Rep invariant:  
    // ??  
  
    public void add(String s) { ... }  
    public boolean remove(String s) { ... }  
    public String get(int i) { ... }  
}
```

NonNullStringList

Implementation 1

```
public class NonNullStringList {  
    // Abstraction function:  
    // Index i in arr contains the ith element in the  
list  
  
    // Rep invariant:  
    // RI = [0,count-1] != null &&  
    // Count >=0 && arr != null  
  
    private String[] arr;  
    private int count;  
  
    public void add(String s) { ... }  
    public boolean remove(String s) { ... }  
    public String get(int i) { ... }  
}
```

Problems?

NonNullStringList Implementation 2

```
public class NonNullStringList {  
    // Abstraction function:  
    // Value in the nth node after head contains the  
    // nth item in the list  
  
    // Rep invariant:  
    // RI = Head has size nodes after it, each whose  
    // value is non-null, no cycle in ListNodes  
  
    public int size;  
    public ListNode head;  
  
    public void add(String s) { ... }  
    public boolean remove(String s) { ... }  
    public String get(int i) { ... }  
}
```
