Section 8: Model-View-Controller

Slides adapted from Alex Mariakakis

with material from Krysta Yousoufian, Kellen Donohue, and James Fogarty

HOMEWORK TIPS

- You must include the @SuppressWarnings("nullness") tags so that your code will build during grading
- * Run ant validate on attu before submitting
- HW7 requires you to modify your code from HW5 and HW6
 - Make sure to address any issues you had that caused you to fail HW5 or HW6 staff tests

MVC

- The classic design pattern
- Used for data-driven user applications
- Such apps juggle several tasks:
 - + Loading and storing the data getting it in/out of storage on request
 - + Constructing the user interface what the user sees
 - + Interpreting user actions deciding whether to modify the UI or data
- These tasks are largely independent of each other
- Model, view, and controller each get one task

MODEL

talks to data source to retrieve and store data

Which database table is the requested data stored in? What SQL query will get me the data I need?

asks model for data and presents it in a user-friendly format

Would this text look better blue or red? In the bottom corner or front and center?

Should these items go in a dropdown list or radio buttons?

CONTROLLER

listens for the user to change data or state in the UI, notifying the model or view accordingly

The user just clicked the "hide details" button. I better tell the view.

The user just changed the event details. I better let the model know to update the data.

BENEFITS OF MVC

Organization of code

+ Maintainable, easy to find what you need

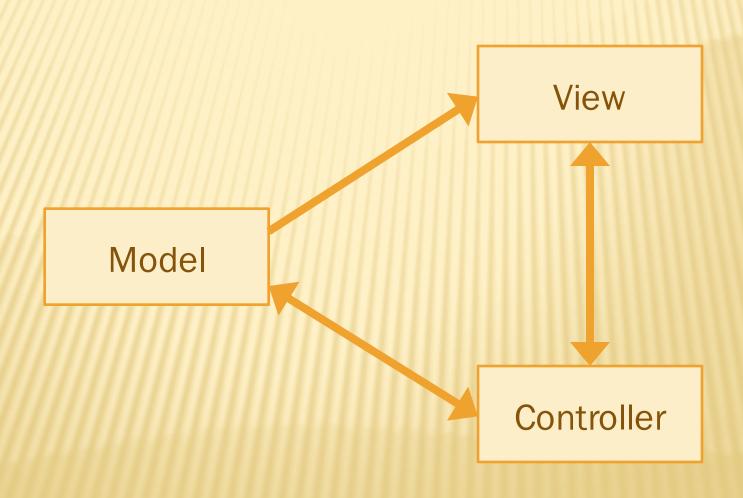

Ease of development

+ Build and test components independently

Flexibility

- + Swap out views for different presentations of the same data (ex: calendar daily, weekly, or monthly view)
- + Swap out models to change data storage without affecting user

MVC FLOW IN THEORY

MVC FLOW

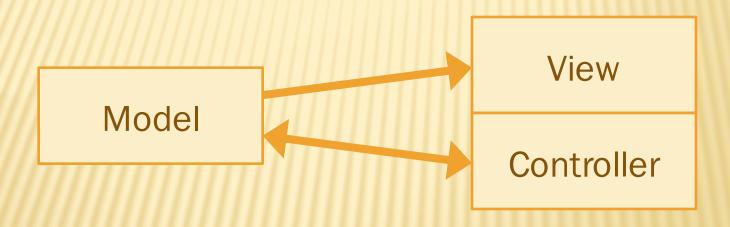

× In theory...

- Pattern of behavior in response to inputs (controller) are independent of visual geometry (view)
- Controller contacts view to interpret what input events should mean in the context of the view

In practice...

- + View and controller are so intertwined that they almost always occur in matched pairs (ex: command line interface)
- + Many architectures combine the two

MVC FLOW IN PRACTICE

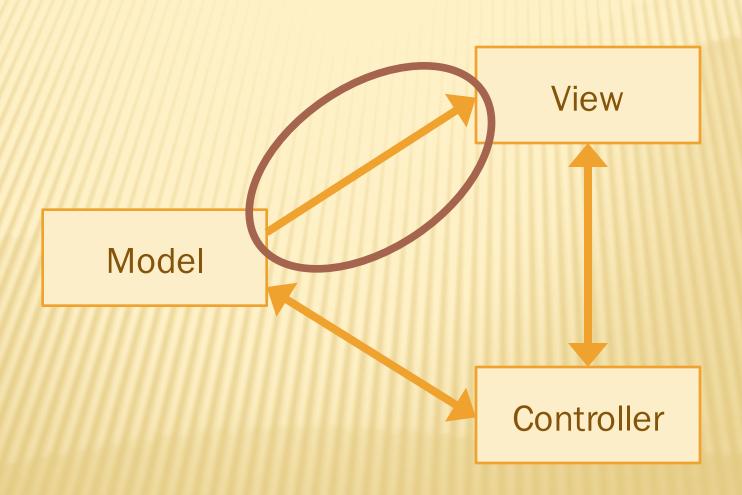

HOMEWORKS

× HW8 – fine to keep view and controller together

HW9 – separate the view and controller

PUSH VS. PULL

PUSH VS. PULL ARCHITECTURE

- Push architecture
 - + As soon as the model changes, it notifies all of the views

- Pull architecture
 - + When a view needs to be updated, it asks the model for new data

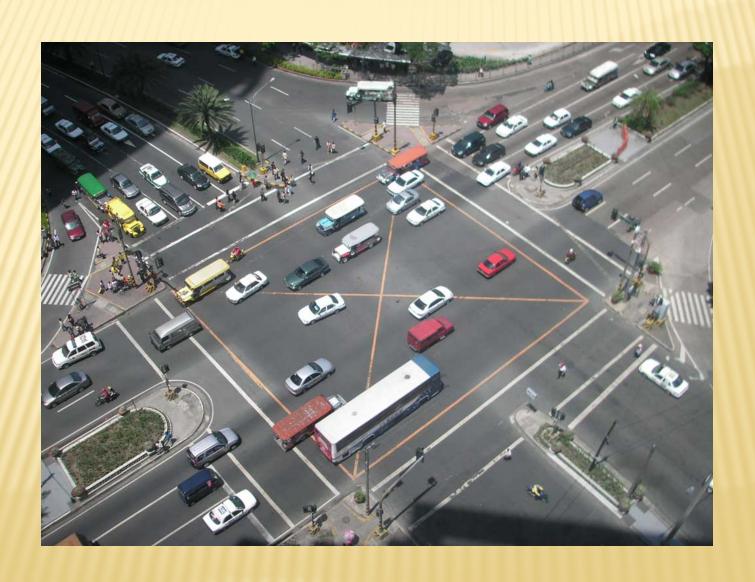

PUSH VS. PULL ARCHITECTURE

PUSH VS. PULL ARCHITECTURE

- Advantages for push
 - + Guaranteed to have latest data in case something goes wrong later on

- Advantages for pull
 - + Avoid unnecessary updates, not nearly as intensive on the view

MVC EXAMPLE - TRAFFIC SIGNAL

TRAFFIC SIGNAL - MVC

Component	Model	View	Controller
Detect cars waiting to enter intersection			X
Traffic lights to direct car traffic			^
Regulate valid traffic movements		X	
Manual override for particular lights	X		
Detect pedestrians waiting to cross			X
Pedestrian signals to direct pedestrians			X
External timer which triggers changes at set interval		X	

TRAFFIC SIGNAL

Model

- + Stores current state of traffic flow
 - Knows current direction of traffic
 - Capable of skipping a light cycle
- + Stores whether there are cars and/or pedestrians waiting

× View

Conveys information to cars and pedestrians in a specific direction

Controller

- + Aware of model's current direction
- + Triggers methods to notify model that state should change

TRAFFIC SIGNAL CODE

Model

+ TrafficModel - keeps track of which lights should be on and off

View

- + CarLight shows relevant state of TrafficModel to cars
- PedestrianLight shows relevant state of TrafficModel to pedestrians

× Controller

- PedestrianButton notifies TrafficModel that there is a pedestrian waiting
- + CarDetector notifies TrafficModel that there is a car waiting
- + LightSwitch enables or disables the light
- + Timer regulates time in some way, possibly to skip cycles

HW8 OVERVIEW

- Apply your generic graph & Dijkstra's to campus map data
- Given a list of buildings and walking paths
- Produce routes from one building to another on the walking paths

HW8 DATA FORMAT

List of buildings (abbreviation, name, loc in pixels)

```
BAG Bagley Hall (East Entrance) 1914.5103,1708.8816
BGR By George 1671.5499,1258.4333
```

List of paths (endpoint 1, endpoint 2, dist in feet)

```
1903.7201,1952.4322

1906.1864,1939.0633: 26.583482327919597
1897.9472,1960.0194: 20.597253035175832
1915.7143,1956.5: 26.68364745009741

2337.0143,806.8278
2346.3446,817.55768: 29.685363221542797
2321.6193,788.16714: 49.5110360968527
2316.4876,813.59229: 44.65826043418031
```

 \times (0,0) is in the upper left

MVC IN HW8

- * Model stores graph, performs Dijkstra's
- View shows results to users in text format

Controller takes user commands and uses view to show results

View and Controller will change in HW9, but Model will stay the same
