## Section 5: HW6 and Midterm

Slides by Vinod Rathnam and Geoffrey Liu
(with material from Alex Mariakakis
Kellen Donohue, David Mailhot, and Hal Perkins)

## Breadth-First Search (BFS)

Often used for discovering connectivity
Calculates the shortest path if and only if all edges have same positive or no weight
Depth-first search (DFS) is commonly mentioned with BFS
BFS looks "wide", DFS looks "deep"
Can also be used for discovery, but not the shortest path

## BFS Pseudocode

```
public boolean find(Node start, Node end) {
    put start node in a queue
    while (queue is not empty) {
        pop node N off queue
        if (N == end)
            return true;
        else {
            for each node O that is child of N
                push O onto queue
        }
    }
    return false;
}
```

## Breadth-First Search

START:<br>$\mathrm{Q}:$ <A><br>Pop: A, Q: <><br>$\mathrm{Q}:<\mathrm{B}, \mathrm{C}>$<br>Pop: B, Q: <C><br>$\mathrm{Q}:<\mathrm{C}>$<br>Pop: C, Q: <C><br>Q: <><br>DONE

Starting at A
Goal: Fully explore

## Breadth-First Search with Cycle

START:
Q: <A>
Pop: A, Q: <>
$\mathrm{Q}:<\mathrm{B}>$
Pop: B, Q: <>
$\mathrm{Q}:<\mathrm{C}>$
Pop: C, Q: <>
$\mathrm{Q}:$ <A>
NEVER DONE

Starting at A
Goal: Fully Explore

## BFS Pseudocode

```
public boolean find(Node start, Node end) {
    put start node in a queue
    while (queue is not empty) {
        pop node N off queue
        mark node N as visited
        if (N is goal)
        return true;
            else {
            for each node O that is child of N
                if O is not marked visited
                push O onto queue
            }
```

    \}
    return false;
    \}

Mark the node as visited!

Abstract Data Types (ADTs)

## Reasoning about code 1

Using backwards reasoning, find the weakest precondition for each sequence of statements and postcondition below. Insert appropriate assertions in each blank line. You should simplify your answers if possible.

```
{____}
z = x + y;
{_____}
y = z - 3;
{x>y}
```

## Reasoning about code 1

Using backwards reasoning, find the weakest precondition for each sequence of statements and postcondition below. Insert appropriate assertions in each blank line. You should simplify your answers if possible.

```
{____}
z = x + y;
{x > z - 3}
y = z - 3;
{x>y}
```

## Reasoning about code 1

Using backwards reasoning, find the weakest precondition for each sequence of statements and postcondition below. Insert appropriate assertions in each blank line. You should simplify your answers if possible.

```
{x>x + y-3 => y< 3}
z = x + y;
{x > z - 3}
y = z - 3;
{x>y}
```

## Reasoning about code 1

Using backwards reasoning, find the weakest precondition for each sequence of statements and postcondition below. Insert appropriate assertions in each blank line. You should simplify your answers if possible.

$p=a+b ;$

$q=a-b ;$
$\{p+q=42\}$

## Reasoning about code 1

Using backwards reasoning, find the weakest precondition for each sequence of statements and postcondition below. Insert appropriate assertions in each blank line. You should simplify your answers if possible.

$$
\begin{aligned}
& \{\ldots \text { ___ }\} \\
& \mathrm{p}=\mathrm{a}+\mathrm{b} ; \\
& \{p+a-b=42\} \\
& q=a-b ; \\
& \{p+q=42\}
\end{aligned}
$$

## Reasoning about code 1

Using backwards reasoning, find the weakest precondition for each sequence of statements and postcondition below. Insert appropriate assertions in each blank line. You should simplify your answers if possible.

$$
\begin{aligned}
& \{a+b+a-b=42 \Rightarrow a=21\} \\
& p=a+b ; \\
& \{p+a-b=42\} \\
& q=a-b ; \\
& \{p+q=42\}
\end{aligned}
$$

## Specification vs. Implementation

Suppose we have a BankAccount class with instance variable balance. Consider the following specifications:
A. @effects decreases balance by amount
B. @requires amount >= 0 and amount <= balance @effects decreases balance by amount
C. @throws InsufficientFundsException
if balance < amount @effects decreases balance by amount

Which specifications does this implementation meet?
I. void withdraw(int amount) \{
balance -= amount;
\}
Another way to ask the question:

If the client does not know the implementation, will the method do what the client expects it to do based on the specification?

## Specification vs. Implementation

Suppose we have a BankAccount class with instance variable balance. Consider the following specifications:
A. @effects decreases balance by amount $\boldsymbol{V}$ does exactly what the spec says
B. @requires amount >= 0 and amount <= balance @effects decreases balance by amount
C. @throws InsufficientFundsException
if balance < amount @effects decreases balance by amount

Which specifications does this implementation meet?
I. void withdraw(int amount) \{
balance -= amount;
\}

## Specification vs. Implementation

Suppose we have a BankAccount class with instance variable balance. Consider the following specifications:
A. @effects decreases balance by amount $\boldsymbol{V}$ does exactly what the spec says
B. @requires amount >= 0 and amount <= balance @effects decreases balance by amount
$\checkmark$ If the client follows the @requires
C. @throws InsufficientFundsException
if balance < amount @effects decreases balance by amount

Which specifications does this implementation meet?
I. void withdraw(int amount) \{
balance -= amount;
\}

## Specification vs. Implementation

Suppose we have a BankAccount class with instance variable balance. Consider the following specifications:
A. @effects decreases balance by amount $\boldsymbol{V}$ does exactly what the spec says
B. @requires amount $>=\boldsymbol{\theta}$ and amount $<=$ balance $\boldsymbol{V}$ If the client follows the @requires @effects decreases balance by amount
C. @throws InsufficientFundsException
if balance < amount @effects decreases balance by amount $\boldsymbol{X}$ Method never throws an exception

Which specifications does this implementation meet?
I. void withdraw(int amount) \{
balance -= amount;
\}

## Specification vs. Implementation

Suppose we have a BankAccount class with instance variable balance. Consider the following specifications:
A. @effects decreases balance by amount
B. @requires amount >= 0 and amount <= balance @effects decreases balance by amount
C. @throws InsufficientFundsException
if balance < amount @effects decreases balance by amount

Which specifications does this implementation meet?

```
II. void withdraw(int amount) {
    if (balance >= amount) balance -= amount;
        }
```

## Specification vs. Implementation

Suppose we have a BankAccount class with instance variable balance. Consider the following specifications:
A. @effects decreases balance by amount $\boldsymbol{X}$ balance does not always decrease
B. @requires amount >= 0 and amount <= balance @effects decreases balance by amount
C. @throws InsufficientFundsException
if balance < amount @effects decreases balance by amount

Which specifications does this implementation meet?

```
II. void withdraw(int amount) {
    if (balance >= amount) balance -= amount;
        }
```

## Specification vs. Implementation

Suppose we have a BankAccount class with instance variable balance. Consider the following specifications:
A. @effects decreases balance by amount
$\boldsymbol{X}$ balance does not always decrease
B. @requires amount >= 0 and amount <= balance
$\checkmark$ If the client follows the @requires @effects decreases balance by amount
C. @throws InsufficientFundsException
if balance < amount @effects decreases balance by amount

Which specifications does this implementation meet?

```
II. void withdraw(int amount) {
            if (balance >= amount) balance -= amount;
        }
```

## Specification vs. Implementation

Suppose we have a BankAccount class with instance variable balance. Consider the following specifications:
A. @effects decreases balance by amount
$\boldsymbol{X}$ balance does not always decrease
B. @requires amount >= 0 and amount <= balance
$\checkmark$ If the client follows the @requires @effects decreases balance by amount
C. @throws InsufficientFundsException
if balance < amount @effects decreases balance by amount $\boldsymbol{X}$ Method never throws an exception

Which specifications does this implementation meet?

```
II. void withdraw(int amount) {
            if (balance >= amount) balance -= amount;
        }
```

## Specification vs. Implementation

Suppose we have a BankAccount class with instance variable balance. Consider the following specifications:
A. @effects decreases balance by amount
B. @requires amount >= 0 and amount <= balance @effects decreases balance by amount
C. @throws InsufficientFundsException
if balance < amount @effects decreases balance by amount

Which specifications does this implementation meet?

```
III.void withdraw(int amount) {
    if (amount < 0) throw new IllegalArgumentException();
    balance -= amount;
    }
```

## Specification vs. Implementation

Suppose we have a BankAccount class with instance variable balance. Consider the following specifications:
A. @effects decreases balance by amount $\boldsymbol{X}$ balance does not always decrease
B. @requires amount >= 0 and amount <= balance @effects decreases balance by amount
C. @throws InsufficientFundsException
if balance < amount @effects decreases balance by amount

Which specifications does this implementation meet?

```
III.void withdraw(int amount) {
    if (amount < 0) throw new IllegalArgumentException();
    balance -= amount;
    }
```

## Specification vs. Implementation

A. @effects decreases balance by amount
$\boldsymbol{X}$ balance does not always decrease
B. @requires amount >= 0 and amount <= balance
$\checkmark$ If the client follows the @requires @effects decreases balance by amount
C. @throws InsufficientFundsException
if balance < amount @effects decreases balance by amount $\quad$ Method does what the spec says

Which specifications does this implementation meet?
IV. void withdraw(int amount) throws InsufficientFundsException \{
if (balance < amount) throw new InsufficientFundsException(); balance -= amount; \}

## Specifications 2

```
/**
    * An IntPoly is an immutable, integer-valued polynomial
    * with integer coefficients. A typical IntPoly value
    * is a_0 + a_1*x + a_2*x^2 + ... + a_n*x_n. An IntPoly
    * with degree n has coefficent a_n != 0, except that the
    * zero polynomial is represented as a polynomial of
    * degree 0 and a_0 = 0 in that case.
    */
public class IntPoly {
    int a[];
    // AF(this) = a has n+1 entries, and for each entry,
    // a[i] = coefficient a_i of the polynomial.
}
```

## Specifications 2

```
/**
    * Return a new IntPoly that is the sum of this and other
    * @requires
    * @modifies
    * @effects
    * @return
    * @throws
    */
public IntPoly add(IntPoly other)
```

## Specifications 2

```
/**
    * Return a new IntPoly that is the sum of this and other
    * @requires other != null
    * @modifies none
    * @effects none
    * @return a new IntPoly representing the sum of this and other
    * @throws none
    */
public IntPoly add(IntPoly other)
```

## Representation invariants

One of your colleagues is worried that this creates a potential representation exposure problem. Another colleague says there's no problem since an IntPoly is immutable. Is there a problem? Give a brief justification for your answer.

```
public class IntPoly {
    int a[];
    // AF(this) = a has n+1 entries, and for each entry,
    // a[i] = coefficient a_i of the polynomial.
    // Return the coefficients of this IntPoly
    public int[] getCoeffs() {
        return a;
    }
}
```

## Representation invariants

One of your colleagues is worried that this creates a potential representation exposure problem. Another colleague says there's no problem since an IntPoly is immutable. Is there a problem? Give a brief justification for your answer.

```
public class IntPoly {
    int a[];
    // AF(this) = a has n+1 entries, and for each entry,
    // a[i] = coefficient a_i of the polynomial.
    // Return the coefficients of this IntPoly
    public int[] getCoeffs() {
        return a; The return value is a reference to the same coefficient
    }
}
    array stored in the IntPoly and the client code could
    alter those coefficients.
```

## Representation invariants

If there is a representation exposure problem, give a new or repaired implementation of getCoeffs that fixes the problem but still returns the coefficients of the IntPoly to the client. If it saves time you can give a precise description of the changes needed instead of writing the detailed Java code.

```
public class IntPoly {
    int a[];
    // AF(this) = a has n+1 entries, and for each entry,
    // a[i] = coefficient a_i of the polynomial.
    // Return the coefficients of this IntPoly
    public int[] getCoeffs() {
        return a;
    }
}
```

## Representation invariants

If there is a representation exposure problem, give a new or repaired implementation of getCoeffs that fixes the problem but still returns the coefficients of the IntPoly to the client. If it saves time you can give a precise description of the changes needed instead of writing the detailed Java code.

```
public int[] getCoeffs() {
    int[] copyA = new int[a.length];
    for (int i = 0; i < copyA.length; i++) {
        copyA[i] = a[i]
    }
    return copyA
}
```

## Representation invariants

If there is a representation exposure problem, give a new or repaired implementation of getCoeffs that fixes the problem but still returns the coefficients of the IntPoly to the client. If it saves time you can give a precise description of the changes needed instead of writing the detailed Java code.

```
public int[] getCoeffs() {
    int[] copyA = new int[a.length];
    for (int i = 0; i < copyA.length; i++) {
        copyA[i] = a[i]
    }
    return copyA 1. Make a copy
    2. Return the copy
```

## Representation invariants

If there is a representation exposure problem, give a new or repaired implementation of getCoeffs that fixes the problem but still returns the coefficients of the IntPoly to the client. If it saves time you can give a precise description of the changes needed instead of writing the detailed Java code.

```
public int[] getCoeffs() {
    int[] copyA = new int[a.length];
    for (int i = 0; i < copyA.length; i++) {
        copyA[i] = a[i]
    }
    return copyA 1. Make a copy
    2. Return the copy
```

Alternatively, we can just use...
Arrays.copyOf(a, a.length)

## Reasoning about code 2

We would like to add a method to this class that evaluates the IntPoly at a particular value $x$. In other words, given a value $x$, the method valueAt ( $x$ ) should return $a_{0}+a_{1} x+a_{2} x^{2}+\ldots+a_{n} x^{n}$, where $a_{0}$ through an are the coefficients of this IntPoly.

For this problem, develop an implementation of this method and prove that your implementation is correct.
(see starter code on next slide)

## Reasoning about code 2

```
/** Return the value of this IntPoly at point x */
public int valueAt(int x) {
    int val = a[0];
    int xk = 1;
    int k = 0;
    int n = a.length-1; // degree of this, n >=0
    {__}
    while (k != n) {
        xk = xk * x;
        {___}
        val = val + a[k+1]*xk;
        {___}
        k = k + 1;
        {___}
    }
    {___}
    return val;
}
```

## Reasoning about code 2

```
/** Return the value of this IntPoly at point x */
public int valueAt(int x) {
    int val = a[0];
    int xk = 1;
    int k = 0;
    int n = a.length-1; // degree of this, n >=0
    {inv: xk = x^k && val = a[0] + a[1]*x + ... + a[k]*x^k}
    while (k != n) {
        {-}
        xk = xk * x;
        {___}
        val = val + a[k+1]*xk;
        {__}
        k = k + 1;
        {____}
    }
    {___}
        }
        return val;
}
```

## Reasoning about code 2

```
/** Return the value of this IntPoly at point x */
public int valueAt(int x) {
    int val = a[0];
    int xk = 1;
    int k = 0;
    int n = a.length-1; // degree of this, n >=0
    {inv: xk = x^k && val = a[0] + a[1]*x + ... + a[k]*x^k}
    while (k != n) {
        {inv && k != n}
        xk = xk * x;
        {___}
        val = val + a[k+1]*xk;
        {
        k = k + 1;
        {___}
    }
    {___}
    return val;
}
```

## Reasoning about code 2

        {xk = x^(k+1) && val = a[0] + a[1]*x + ... + a[k+1]*x^(k+1)}
        k = k + 1;
        {inv}
    }
    {inv && k = n = val = a[0] + a[1]*x + ... + a[n]*x^n}
    return val;
}
```

## Equality

Suppose we are defining a class StockItem to represent items stocked by an online grocery store. Here is the start of the class definition, including the class name and instance variables:

```
public class StockItem {
    String name;
    String size;
    String description;
    int quantity;
    /* Construct a new StockItem */
    public StockItem(...);
}
```

## Equality

A summer intern was asked to implement an equals function for this class that treats two StockItem objects as equal if their name and size fields match. Here's the result:

```
/** return true if the name and size fields match */
public boolean equals(StockItem other) {
    return name.equals(other.name) && size.equals(other.size);
}
```

This equals method seems to work sometimes but not always. Give an example showing a situation when it fails.

## Equality

A summer intern was asked to implement an equals function for this class that treats two StockItem objects as equal if their name and size fields match. Here's the result:

```
/** return true if the name and size fields match */
public boolean equals(StockItem other) {
    return name.equals(other.name) && size.equals(other.size);
}
```

This equals method seems to work sometimes but not always. Give an example showing a situation when it fails.

```
Object s1 = new StockItem("thing", 1, "stuff", 1);
Object s2 = new StockItem("thing", 1, "stuff", 1);
System.out.println(s1.equals(s2));
```

## Equality

A summer intern was asked to implement an equals function for this class that treats two StockItem objects as equal if their name and size fields match. Here's the result:

```
/** return true if the name and size fields match */
public boolean equals(StockItem other) { // equals is overloaded, not overridden
        return name.equals(other.name) && size.equals(other.size);
}
```

This equals method seems to work sometimes but not always. Give an example showing a situation when it fails.

```
Object s1 = new StockItem("thing", 1, "stuff", 1);
Object s2 = new StockItem("thing", 1, "stuff", 1);
System.out.println(s1.equals(s2));
```

## Equality

Show how you would fix the equals method so it works properly (StockItems are equal if their names and sizes are equal)
/** return true if the name and size fields match */

## Equality

Show how you would fix the equals method so it works properly (StockItems are equal if their names and sizes are equal)
/** return true if the name and size fields match */
@Override
public boolean equals(Object o) \{
if (!(o instanceof StockItem)) \{ return false;
\}
StockItem other = (StockItem) o;
return name.equals(other.name) \&\& size.equals(other.size);
\}

## hashCode

Which of the following implementations of hashCode( ) for the StockItem class are legal:

1. return name.hashCode();
2. return name.hashCode() * $17+$ size.hashCode();
3. return name.hashCode() * 17 + quantity;
4. return quantity;

## hashCode

Which of the following implementations of hashCode( ) for the StockItem class are legal:

1. return name.hashCode(); $\checkmark$ legal
2. return name.hashCode() * $17+$ size.hashCode();
3. return name.hashCode() * 17 + quantity;
4. return quantity;

## hashCode

Which of the following implementations of hashCode( ) for the StockItem class are legal:

1. return name.hashCode(); $\checkmark$ legal
2. return name.hashCode() * $17+$ size.hashCode(); $\quad \cup$ legal
3. return name.hashCode() * 17 + quantity;
4. return quantity;

## hashCode

Which of the following implementations of hashCode( ) for the StockItem class are legal:

1. return name.hashCode(); $\checkmark$ legal
2. return name.hashCode() * $17+$ size.hashCode(); $\quad \cup$ legal
3. return name.hashCode() * 17 + quantity; $\mathbf{X}$ illegal!
4. return quantity;

## hashCode

Which of the following implementations of hashCode( ) for the StockItem class are legal:

1. return name.hashCode(); $\checkmark$ legal
2. return name.hashCode() * $17+$ size.hashCode(); $\quad \cup$ legal
3. return name.hashCode() * 17 + quantity; $\mathbf{X}$ illegal!
4. return quantity; X illegal!

## hashCode

Which of the following implementations of hashCode( ) for the StockItem class are legal:

1. return name.hashCode(); $\checkmark$ legal
2. return name.hashCode() * $17+$ size.hashCode(); $\quad \checkmark$ legal
3. return name.hashCode() * 17 + quantity; $\mathbf{X}$ illegal!
4. return quantity; $\mathbf{X}$ illegal!

The equals method does
not care about quantity

## hashCode

```
Which implementation do you prefer?
public int hashCode() {
    return name.hashCode();
}
public int hashCode() {
    return name.hashCode()*17 + size.hashCode();
}
```

## hashCode

```
Which implementation do you prefer?
public int hashCode() {
    return name.hashCode();
}
public int hashCode() {
    return name.hashCode()*17 + size.hashCode();
}
```
