Loops & Recursion

Kevin Zatloukal

Administrivia

- Posted *updated notes on testing*
 - 0-1-many used for loops also
 - count number of times through the loop
- Posted notes on today's topic...

Checking Correctness with Loop Invariants

```
 {{ P }}  
 {{ Inv: I }}  
 while (cond) {  
   S  
 }  
 {{ Q }}
```

Formally, invariant split this into three Hoare triples:

1. $\{\{ P \}\} \{\{ I \}\}$ I holds initially
2. $\{\{ I \text{ and cond } \}\} S \{\{ I \}\}$ S preserves I
3. $\{\{ I \text{ and not cond } \}\} \{\{ Q \}\}$ Q holds when loop exits

Recall: Example Loop Correctness

- Recursive function to calculate $1 + 2 + \dots + n$

```
func sum-to(0)    := 0
      sum-to(n+1):= (n+1) + sum-to(n)           for any n :  $\mathbb{N}$ 
```

- This loop claims to calculate it as well

```
 {{ }}
let i: number = 0;
let s: number = 0;
{{ Inv: s = sum-to(i) }}
while (i != n) {
    i = i + 1;
    s = s + i;
}
{{ s = sum-to(n) }}
```

Example Loop Correctness

- Recursive function to calculate $1 + 2 + \dots + n$

```
func sum-to(0)    := 0  
    sum-to(n+1):= (n+1) + sum-to(n)           for any n :  $\mathbb{N}$ 
```

- This loop claims to calculate it as well

```
{ $\{ \}$ }  
let i: number = 0;  
let s: number = 0;  
{{ i = 0 and s = 0 }}  
{{ Inv: s = sum-to(i) }}  
while (i != n) {  
    ...  
    }  
    } ] sum-to(i)  
    = sum-to(0)      since i = 0  
    = 0              def of sum-to  
    = s
```

Example Loop Correctness

- Recursive function to calculate $1 + 2 + \dots + n$

```
func sum-to(0)    := 0
      sum-to(n+1):= (n+1) + sum-to(n)           for any n :  $\mathbb{N}$ 
```

- This loop claims to calculate it as well

```
{ $\{$  Inv: s = sum-to(i)  $\}$ }
while (i != n) {
  { $\{$  s = sum-to(i) and i  $\neq$  n  $\}$ }  
  i = i + 1;
  s = s + i;
  { $\{$  s = sum-to(i)  $\}$ }  
}
```

Example Loop Correctness

- Recursive function to calculate $1 + 2 + \dots + n$

```
func sum-to(0)    := 0
    sum-to(n+1):= (n+1) + sum-to(n)           for any n :  $\mathbb{N}$ 
```

- This loop claims to calculate it as well

```
{ $\{$  Inv: s = sum-to(i)  $\}$ }
while (i != n) {
    { $\{$  s = sum-to(i) and i  $\neq$  n  $\}$ }
    i = i + 1;
    { $\{$  s = sum-to(i-1) and i-1  $\neq$  n  $\}$ }
    s = s + i;
    { $\{$  s = sum-to(i)  $\}$ }
}
```

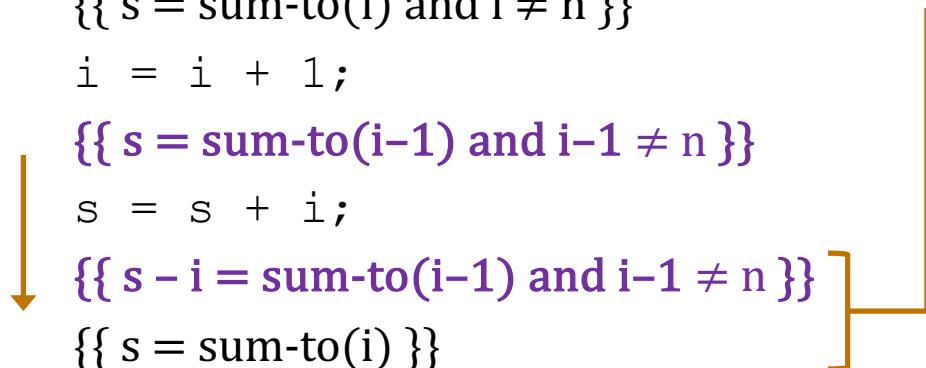

Example Loop Correctness

- Recursive function to calculate $1 + 2 + \dots + n$

```
func sum-to(0)    := 0
      sum-to(n+1):= (n+1) + sum-to(n)           for any n :  $\mathbb{N}$ 
```

- This loop claims to calculate it as well

```
{ $\{\text{ Inv: } s = \text{sum-to}(i)\}$ }  
while (i != n) {  
  { $\{s = \text{sum-to}(i)$  and  $i \neq n\}$ }  
  i = i + 1;  
  { $\{s = \text{sum-to}(i-1)$  and  $i-1 \neq n\}$ }  
  s = s + i;  
  { $\{s - i = \text{sum-to}(i-1)$  and  $i-1 \neq n\}$ }  
  { $\{s = \text{sum-to}(i)\}$ }  
}  
s = i + sum-to(i-1)  
= sum-to(i)           since  $s - i = \text{sum-to}(i-1)$   
                      def of sum-to
```

Example Loop Correctness

- Recursive function to calculate $1 + 2 + \dots + n$

```
func sum-to(0)    := 0
      sum-to(n+1):= (n+1) + sum-to(n)           for any n :  $\mathbb{N}$ 
```

- This loop claims to calculate it as well

```
{ $\{$  Inv: s = sum-to(i)  $\}$ }  
while (i != n) {  
    i = i + 1;  
    s = s + i;  
}  
 $\{$  s = sum-to(i) and i = n  $\}$  ]  
 $\{$  s = sum-to(n)  $\}$  ]
```

$\begin{matrix} \text{sum-to}(n) \\ = \text{sum-to}(i) \\ = s \end{matrix}$ since $i = n$
since $s = \text{sum-to}(i)$

Loops & Recursion

Loops and Recursion

- To check a loop, we need a **loop invariant**
- Where does this come from?
 - part of the algorithm idea / design
see 421 for more discussion
 - Inv and the progress step **formalize** the algorithm idea
most programmers can easily formalize an English description
(very tricky loops are the exception to this)
- Today, we'll focus on converting *recursion* into a loop
 - HW6 will fit these patterns
 - (more loops later)

Example Loop Correctness

- Recursive function to calculate n^2 without multiplying

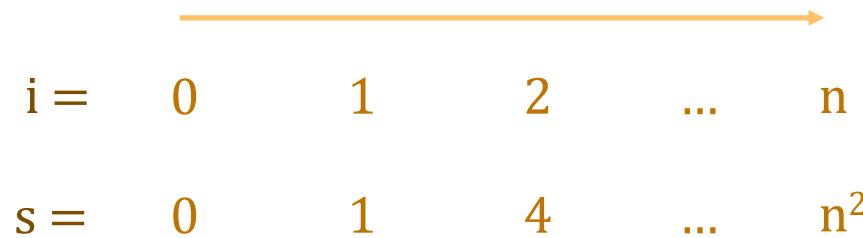

```
func square(0)    := 0  
square(n+1) := square(n) + 2n + 1           for any n :  $\mathbb{N}$ 
```

- We already proved that this calculates n^2
 - we can implement it directly with recursion
- Let's try writing it with a loop instead...

Example Loop Correctness

```
func square(0)    := 0  
    square(n+1) := square(n) + 2n + 1           for any n :  $\mathbb{N}$ 
```

- **Loop idea for calculating $\text{square}(n)$:**
 - calculate $i = 0, 1, 2, \dots, n$
 - keep track of $\text{square}(i)$ in “ s ” as we go along

- **Formalize that idea in the loop invariant**
along with the fact that we make **progress** by advancing i to $i+1$ each step

Example Loop Correctness

```
func square(0)    := 0
square(n+1) := square(n) + 2n + 1           for any n :  $\mathbb{N}$ 
```

- **Loop implementation**

```
let i: number = 0;
let s: number = 0;
{{ Inv: s = square(i) }}
while (i != n) {
    s = s + i + i + 1;
    i = i + 1;
}
return s;
```

Loop invariant says how i and s relate
 s holds $\text{square}(i)$, whatever i

i starts at 0 and increases to n

Now we can check correctness...

Example Loop Correctness

```
func square(0)    := 0
square(n+1) := square(n) + 2n + 1           for any n :  $\mathbb{N}$ 
```

- **Loop implementation**

```
let i: number = 0;
let s: number = 0;
{{ Inv: s = square(i) }}
while (i != n) {
    s = s + i + i + 1;
    i = i + 1;
}
{{ s = square(i) and i = n }}
{{ s = square(n) }}
return s;
```

square(n)
= square(i)
= s

since $i = n$
since $s = \text{square}(i)$

Example Loop Correctness

```
func square(0)    := 0
    square(n+1) := square(n) + 2n + 1           for any n :  $\mathbb{N}$ 
```

- Loop implementation

```
{ $\{\}$ }  
let i: number = 0;  
let s: number = 0;  
{{ i = 0 and s = 0 }}  
{ $\{\text{ Inv: } s = \text{square}(i)\}$ }  
while (i != n) {  
    s = s + i + i + 1;  
    i = i + 1;  
}  
return s;
```

] square(i)
= square(0) since i = 0
= 0 def of square
= s since s = 0

Example Loop Correctness

```
func square(0)    := 0
    square(n+1) := square(n) + 2n + 1           for any n :  $\mathbb{N}$ 
```

- **Loop implementation**

```
{ $\{$  Inv: s = square(i)  $\}$ }
while (i != n) {
    { $\{$  s = square(i) and i  $\neq$  n  $\}$ }
    s = s + i + i + 1;
    { $\{$  s = square(i+1)  $\}$ }
    i = i + 1;
    { $\{$  s = square(i)  $\}$ }
}
return s;
```

Example Loop Correctness

```
func square(0)    := 0
    square(n+1) := square(n) + 2n + 1           for any n :  $\mathbb{N}$ 
```

- **Loop implementation**

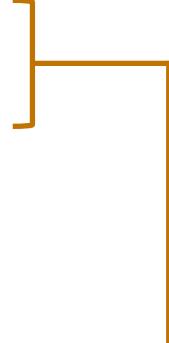

```
 {{ Inv: s = square(i) }}
while (i != n) {
    {{ s = square(i) and i ≠ n }}
    {{ s + 2i + 1 = square(i+1) }}
    ↑
    s = s + i + i + 1;
    {{ s = square(i+1) }}
    i = i + 1;
    {{ s = square(i) }}
}
return s;
```

Example Loop Correctness

```
func square(0)    := 0
    square(n+1) := square(n) + 2n + 1           for any n :  $\mathbb{N}$ 
```

- **Loop implementation**

```
 {{ Inv: s = square(i) }}  
while (i != n) {  
    {{ s = square(i) and i ≠ n }}  
    {{ s + 2i + 1 = square(i+1) }}  
    s = s + i + i + 1;  
    {{ s = square(i+1) }}  
    i = i + 1;  
    {{ s = square(i) }}    s + 2i + 1 = square(i) + 2i + 1  
}                                = square(i+1)           since s = square(i)  
                                         def of square  
return s;
```

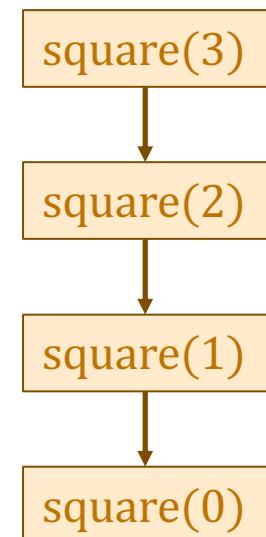

“Bottom Up” Loops on Natural Numbers

- Previous examples store function value in a variable

$\{\{ \text{Inv: } s = \text{sum-to}(i) \}\}$

$\{\{ \text{Inv: } s = \text{square}(i) \}\}$

- Start with $i = 0$ and work up to $i = n$
- Call this a “bottom up” implementation
 - evaluates in the same order as recursion
 - from the base case up to the full input

“Bottom Up” Loops on the Natural Numbers

```
func f(0)      := ...
f(n+1) := ... f(n) ...
for any n :  $\mathbb{N}$ 
```

- Can be implemented with a loop like this

```
const f = (n: number) : number => {
    let i: number = 0;
    let s: number = "..."; // = f(0)
    {{ Inv: s = f(i) }}
    while (i != n) {
        s = "... f(i) ..." [f(i) ↪ s] // = f(i+1)
        i = i + 1;
    }
    return s;
};
```

“Bottom Up” Loops on Lists

- Works nicely on \mathbb{N}
 - numbers are built up from 0 using succ (+1)
 - e.g., build $n = 3$ up from 0

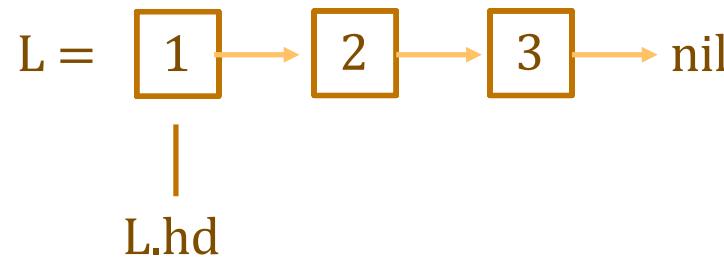

$$n = \quad 3 \xleftarrow{+1} 2 \xleftarrow{+1} 1 \xleftarrow{+1} 0$$

- What about List?
 - lists are built up from nil using cons
 - e.g., build $L = \text{cons}(c, \text{cons}(b, \text{cons}(a, \text{nil})))$ from nil:

$$L = \boxed{c} \rightarrow \boxed{b} \rightarrow \boxed{a} \rightarrow \text{nil}$$

“Bottom Up” Loops on Lists?

- **What about List?**
 - lists are built up from nil using cons
 - e.g., build $L = \text{cons}(1, \text{cons}(2, \text{cons}(3, \text{nil})))$ from nil:

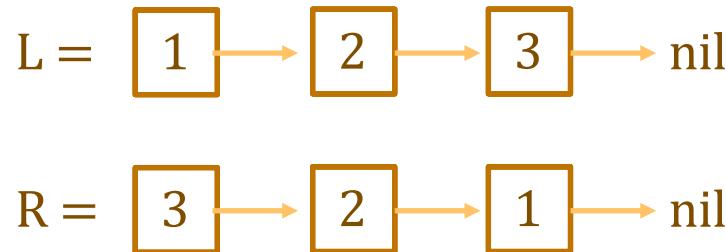

- **First step to build L is to build $\text{cons}(3, \text{nil})$ from nil**
 - how do we know what number to put in front of nil?
 - 3 is all the way at the end of the list!
 - how can we fix this?
 - reverse the list!

Example “Bottom Up” List Loop

```
func twice(nil)      := nil  
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

- **Loop idea for calculating $\text{twice}(L)$:**
 - **store $\text{rev}(L)$ in “R”**

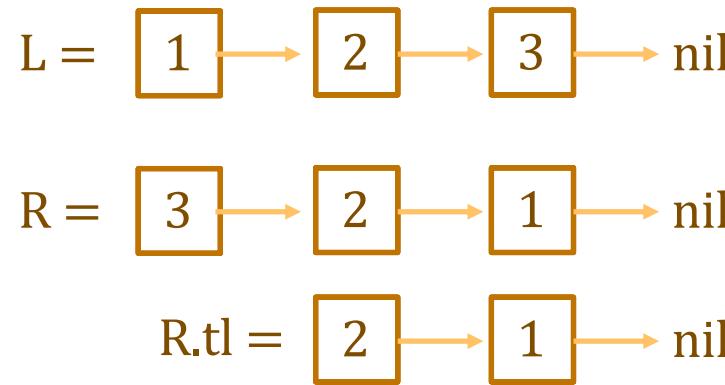

- **watch what happens as we move R forward...**

Example “Bottom Up” List Loop

```
func twice(nil)      := nil  
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

- **Loop idea for calculating $\text{twice}(L)$:**
 - **store $\text{rev}(L)$ in “R”**
 - **moving forward in R is moving backward in L...**

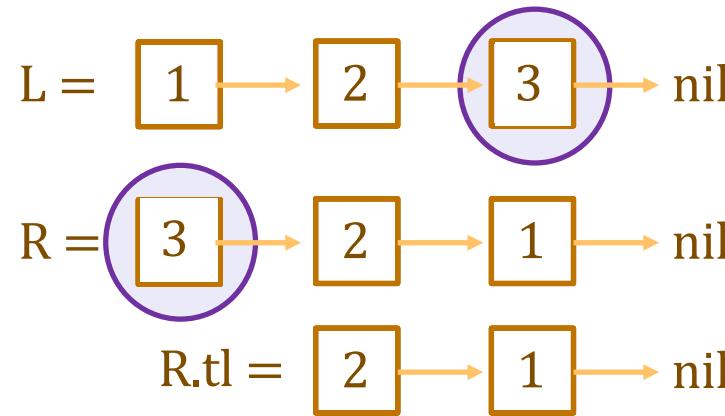

- as R moves forward, $\text{rev}(R)$ remains a prefix of L

Example “Bottom Up” List Loop

```
func twice(nil)      := nil  
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

- **Loop idea for calculating $\text{twice}(L)$:**
 - **store $\text{rev}(L)$ in “R”**
 - **moving forward in R is moving backward in L...**

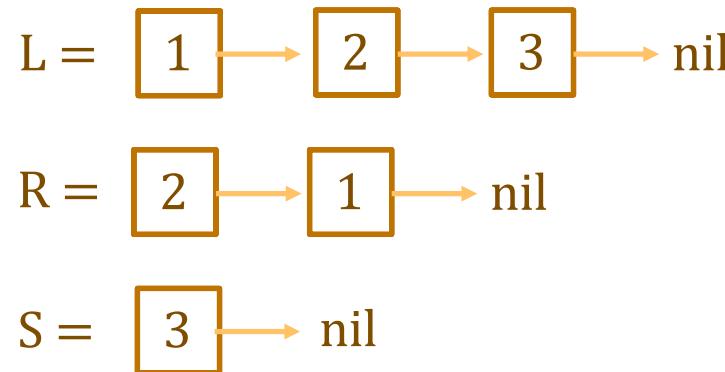

- **value dropped from R was $\text{last}(L) = 3$**
can use it to build $\text{cons}(3, \text{nil})$

Example “Bottom Up” List Loop

```
func twice(nil)      := nil  
twice(cons(x, L)) := cons(2x, twice(L))  for any x :  $\mathbb{Z}$  and L : List
```

- **Loop idea for calculating $\text{twice}(L)$:**
 - store $\text{rev}(L)$ in “R” initially. move forward to R.tl, etc.
 - add items skipped over by R to the front of “S”

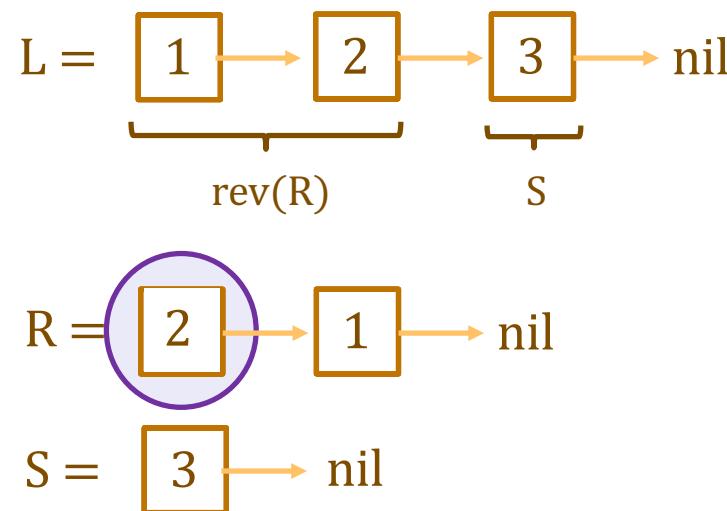

- as R moves forward, S stores a suffix of L

Example “Bottom Up” List Loop

```
func twice(nil)      := nil  
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

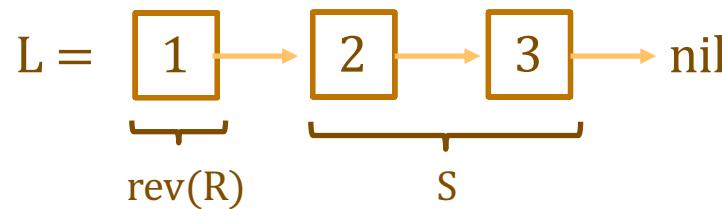

- **Loop idea for calculating $\text{twice}(L)$:**
 - store $\text{rev}(L)$ in “R” initially. move forward to $R.\text{tl}$, etc.
 - add items skipped over by R to the front of “S”

Example “Bottom Up” List Loop

```
func twice(nil)      := nil  
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

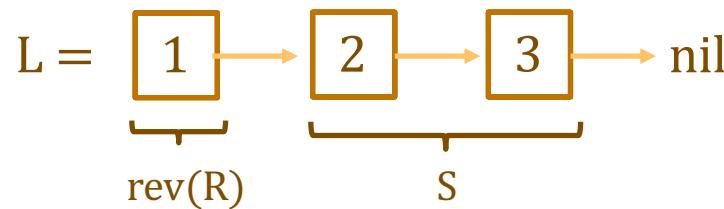

- **Loop idea for calculating $\text{twice}(L)$:**
 - store $\text{rev}(L)$ in “R” initially. move forward to $R.\text{tl}$, etc.
 - add items skipped over by R to the front of “S”

Example “Bottom Up” List Loop

```
func twice(nil)      := nil  
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

- **Loop idea for calculating $\text{twice}(L)$:**
 - store $\text{rev}(L)$ in “R” initially. move forward to $R.\text{tl}$, etc.
 - add items skipped over by R to the front of “S”

- Formalize that idea in the **loop invariant**

$$L = \text{concat}(\text{rev}(R), S)$$

Example “Bottom Up” List Loop

```
func twice(nil)      := nil
twice(cons(x, L)) := cons(2x, twice(L))  for any x :  $\mathbb{Z}$  and L : List
```

- **Loop idea for calculating $\text{twice}(L)$:**
 - store $\text{rev}(L)$ in “R” initially
 - add items skipped over by R to the front of “S”
 - advance by moving R forward (shrinking R, growing S)
 S is built “bottom up” into the entire list L
 - calculate $\text{twice}(S)$, as we go, in “T”
- **Formalize that idea in the loop invariant**

$$L = \text{concat}(\text{rev}(R), S) \text{ and } T = \text{twice}(S)$$

Example “Bottom Up” List Loop

```
func twice(nil)      := nil
twice(cons(x, L)) := cons(2x, twice(L))  for any x :  $\mathbb{Z}$  and L : List
```

- This loop claims to calculate $\text{twice}(L)$...

```
let R: List = rev(L);
let S: List = nil;
let T: List = nil;
{{ Inv: L = concat(rev(R), S) and T = twice(S) }}
while (R !== nil) {
    T = cons(2 * R.hd, T);  Still need to check this.
    S = cons(R.hd, S);      Hopefully obvious that it could be wrong.
    R = R.tl;                (Testing length 0, 1, 2, 3 is not enough!)
}
return T; // = twice(L)
```

Example “Bottom Up” List Loop

```
func twice(nil)      := nil
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

- This loop claims to calculate $\text{twice}(L)$

```
...
{{ Inv: L = concat(rev(R), S) and T = twice(S) }}
while (R != nil) {
    T = cons(2 * R.hd, T);
    S = cons(R.hd, S);
    R = R.tl;
}
{{ L = concat(rev(R), S) and T = twice(S) and R = nil }}]
{{ T = twice(L) }}]
return T; // = twice(L)
```

Example “Bottom Up” List Loop

```
func twice(nil)      := nil  
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

- Check that Inv is implies the postcondition:

$\{\{ L = \text{concat}(\text{rev}(R), S) \text{ and } T = \text{twice}(S) \text{ and } R = \text{nil} \}\}$
 $\{\{ T = \text{twice}(L) \}\}$

$$\begin{aligned} L &= \text{concat}(\text{rev}(R), S) \\ &= \text{concat}(\text{rev}(\text{nil}), S) && \text{since } R = \text{nil} \\ &= \text{concat}(\text{nil}, S) && \text{def of rev} \\ &= S && \text{def of concat} \end{aligned}$$

$$\begin{aligned} T &= \text{twice}(S) \\ &= \text{twice}(L) && \text{since } L = S \end{aligned}$$

Example “Bottom Up” List Loop

```
func twice(nil)      := nil  
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

- This loop claims to calculate $\text{twice}(L)$

```
{ $\{\}$ }  
let R: List = rev(L);  
let S: List = nil;  
let T: List = nil;  
{ $\{ R = \text{rev}(L) \text{ and } S = \text{nil} \text{ and } T = \text{nil} \}$ }  
{ $\{ \text{Inv: } L = \text{concat}(\text{rev}(R), S) \text{ and } T = \text{twice}(S) \}$ }  
while (R != $\text{nil}$ ) {  
    T = cons(2 * R.hd, T);  
    S = cons(R.hd, S);  
    R = R.tl;  
}
```

Example “Bottom Up” List Loop

```
func twice(nil)      := nil  
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

- Check that Inv is true initially:

$\{\{ R = \text{rev}(L) \text{ and } S = \text{nil} \text{ and } T = \text{nil} \}\}$

$\{\{ \text{Inv: } L = \text{concat}(\text{rev}(R), S) \text{ and } T = \text{twice}(S) \}\}$

$\text{concat}(\text{rev}(R), S)$

$= \text{concat}(\text{rev}(\text{rev}(L)), S)$ since $R = \text{rev}(L)$

$= \text{concat}(L, S)$ Lemma 3

$= \text{concat}(L, \text{nil})$ since $S = \text{nil}$

$= L$ Lemma 2

$\text{twice}(S)$

$= \text{twice}(\text{nil})$ since $S = \text{nil}$

$= \text{nil}$ def of twice

$= T$ since $T = \text{nil}$

Example “Bottom Up” List Loop

```
func twice(nil)      := nil
twice(cons(x, L)) := cons(2x, twice(L))  for any x :  $\mathbb{Z}$  and L : List
```

- This loop claims to calculate $\text{twice}(L)$

```
{ $\{\$  Inv: L = concat(rev(R), S) and T = twice(S)  $\}\}$ 
while (R != nil) {
    { $\{\$  L = concat(rev(R), S) and T = twice(S) and R ≠ nil  $\}\}$ 
    T = cons(2 * R.hd, T);
    S = cons(R.hd, S);
    R = R.tl;
    { $\{\$  L = concat(rev(R), S) and T = twice(S)  $\}\}$ 
}
```

Example “Bottom Up” List Loop

```
func twice(nil)      := nil
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

- This loop claims to calculate $\text{twice}(L)$

```
{ $\{\$  Inv: L = concat(rev(R), S) and T = twice(S)  $\}\}$ 
while (R != nil) {
    { $\{\$  L = concat(rev(R), S) and T = twice(S) and R ≠ nil  $\}\}$ 
    T = cons(2 * R.hd, T);
    S = cons(R.hd, S);
    { $\{\$  L = concat(rev(R.tl), S) and T = twice(S)  $\}\}$ 
    R = R.tl;
    { $\{\$  L = concat(rev(R), S) and T = twice(S)  $\}\}$ 
}
```

Example “Bottom Up” List Loop

```
func twice(nil)      := nil
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

- This loop claims to calculate $\text{twice}(L)$

```
{ $\{\$  Inv: L = concat(rev(R), S) and T = twice(S)  $\}\}$ 
while (R != nil) {
    { $\{\$  L = concat(rev(R), S) and T = twice(S) and R ≠ nil  $\}\}$ 
    T = cons(2 * R.hd, T);
    { $\{\$  L = concat(rev(R.tl), cons(R.hd, S)) and T = twice(S)  $\}\}$ 
    S = cons(R.hd, S);
    { $\{\$  L = concat(rev(R.tl), S) and T = twice(S)  $\}\}$ 
    R = R.tl;
    { $\{\$  L = concat(rev(R), S) and T = twice(S)  $\}\}$ 
}
```

Example “Bottom Up” List Loop

```
func twice(nil)      := nil
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

- This loop claims to calculate $\text{twice}(L)$

```
 {{ Inv: L = concat(rev(R), S) and T = twice(S) }}
while (R != nil) {
    {{ L = concat(rev(R), S) and T = twice(S) and R != nil }}
    {{ L = concat(rev(R.tl), cons(R.hd, S)) and cons(2·R.hd, T) = twice(cons(R.hd, S)) }}
    ↑
    T = cons(2 * R.hd, T);
    {{ L = concat(rev(R.tl), cons(R.hd, S)) and T = twice(cons(R.hd, S)) }}
    S = cons(R.hd, S);
    {{ L = concat(rev(R.tl), S) and T = twice(S) }}
    R = R.tl;
    {{ L = concat(rev(R), S) and T = twice(S) }}
}
}
```

Example “Bottom Up” List Loop

```
func twice(nil)      := nil  
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

- Check that Inv is preserved by the loop body:

$\{\{ L = \text{concat}(\text{rev}(R), S) \text{ and } T = \text{twice}(S) \text{ and } R \neq \text{nil} \}\}$

$\{\{ L = \text{concat}(\text{rev}(R.\text{tl}), \text{cons}(R.\text{hd}, S)) \text{ and } \text{cons}(2 \cdot R.\text{hd}, T) = \text{twice}(\text{cons}(R.\text{hd}, S)) \}\}$

$$\begin{aligned} &\text{twice}(\text{cons}(R.\text{hd}, S)) \\ &= \text{cons}(2 R.\text{hd}, \text{twice}(S)) \quad \text{def of twice} \\ &= \text{cons}(2 R.\text{hd}, T) \quad \text{since } T = \text{twice}(S) \end{aligned}$$

Note that $R \neq \text{nil}$ means $R = \text{cons}(R.\text{hd}, R.\text{tl})$

Example “Bottom Up” List Loop

```
func twice(nil)      := nil  
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

- Check that Inv is preserved by the loop body:

$\{\{ L = \text{concat}(\text{rev}(R), S) \text{ and } T = \text{twice}(S) \text{ and } R \neq \text{nil} \}\}$

$\{\{ L = \text{concat}(\text{rev}(R.\text{tl}), \text{cons}(R.\text{hd}, S)) \text{ and } \text{cons}(2 \cdot R.\text{hd}, T) = \text{twice}(\text{cons}(R.\text{hd}, S)) \}\}$

$$\begin{aligned} L &= \text{concat}(\text{rev}(R), S) \\ &= \text{concat}(\text{rev}(\text{cons}(R.\text{hd}, R.\text{tl})), S) && \text{since } R \neq \text{nil} \\ &= \text{concat}(\text{concat}(\text{rev}(R.\text{tl}), \text{cons}(R.\text{hd}, \text{nil})), S) && \text{def of rev} \\ &= \text{concat}(\text{rev}(R.\text{tl}), \text{concat}(\text{cons}(R.\text{hd}, \text{nil}), S)) && \text{Lemma 2} \\ &= \text{concat}(\text{rev}(R.\text{tl}), \text{cons}(R.\text{hd}, \text{concat}(\text{nil}, S))) && \text{def of concat} \\ &= \text{concat}(\text{rev}(R.\text{tl}), \text{cons}(R.\text{hd}, S)) && \text{def of concat} \end{aligned}$$

Example “Bottom Up” List Loop

```
func twice(nil)      := nil
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

- This loop claims to calculate $\text{twice}(L)$

```
let R: List = rev(L);
let S: List = nil;
let T: List = nil;
{{ Inv: L = concat(rev(R), S) and T = twice(S) }}
while (R !== nil) {
    T = cons(2 * R.hd, T);
    S = cons(R.hd, S);
    R = R.tl;
}
return T; // = twice(L)
```

“S” is unused! We could remove it.

“S” is useful for proving correctness
but it is not needed at run-time.
(Example of a “ghost” variable.)

“Bottom Up” Loops on Lists

```
func f(nil)           := ...
f(cons(x, L)) := ... f(L) ...
for any x :  $\mathbb{Z}$  and L : List
```

- Can be implemented with a loop like this

```
const f = (L: List): List => {
    let R: List = rev(L);
    let S: List = nil;
    let T: List = ...; // = f(nil)
    {{ Inv: L = concat(rev(R), S) and T = f(S) }}
    while (R !== nil) {
        T = "... f(L) ..." [f(L) ↪ T]
        S = cons(R.hd, S);
        R = R.tl;
    }
    return T; // = f(L)
};
```

Tail Recursion

```
func twice(nil)      := nil
twice(cons(x, L)) := cons(2x, twice(L)) for any x :  $\mathbb{Z}$  and L : List
```

- **To calculate $\text{twice}(\text{cons}(x, L))$:**
 - recursively calculate $S = \text{twice}(L)$
 - when that returns, construct and return $\text{cons}(2x, S)$
- **Not all functions require work after recursion:**

```
func rev-acc(nil, R)      := R           for any R : List
rev-acc(cons(x, L), R) := rev-acc(L, cons(x, R)) for any x :  $\mathbb{Z}$  and
                                         any L, R : List
```

- such functions are called “tail recursive”

“Top Down” List Loop

```
func rev-acc(nil, R)      := R
    rev-acc(cons(x, L), R) := rev-acc(L, cons(x, R))
```

- Tail recursion can be implemented top-down
 - no need to reverse the list

```
const rev_acc = (S: List, R: List): List => {
    {{ Inv: rev-acc(S0, R0) = rev-acc(S, R) }}
    while (S !== nil) {
        R = cons(S.hd, R);
        S = S.tl;
    }
    return R; // = rev-acc(S0, R0)
};
```

Easy to see that Inv holds initially
since $S = S_0$ and $R = R_0$

“Top Down” List Loop

```
func rev-acc(nil, R)           := R
    rev-acc(cons(x, L), R)  := rev-acc(L, cons(x, R))
```

- Check that the postcondition holds upon exit:

```
const rev_acc = (S: List, R: List): List => {
    {{ Inv: rev-acc(S0, R0) = rev-acc(S, R) }}
    while (S !== nil) {
        R = cons(S.hd, R);
        S = S.tl;
    }
    {{ rev-acc(S0, R0) = rev-acc(S, R) and S = nil }}
    {{ R = rev-acc(S0, R0) }}
    return R; // = rev-acc(S0, R0)
};
```

“Top Down” List Loop

```
func rev-acc(nil, R)      := R  
    rev-acc(cons(x, L), R) := rev-acc(L, cons(x, R))
```

- Check that the postcondition holds upon exit:

$\{\{ \text{rev-acc}(S_0, R_0) = \text{rev-acc}(S, R) \text{ and } S = \text{nil} \}\}$
 $\{\{ R = \text{rev-acc}(S_0, R_0) \}\}$

$\text{rev-acc}(S_0, R_0)$
= $\text{rev-acc}(S, R)$
= $\text{rev-acc}(\text{nil}, R)$ since $S = \text{nil}$
= R def of rev-acc

“Top Down” List Loop

```
func rev-acc(nil, R)           := R
    rev-acc(cons(x, L), R)  := rev-acc(L, cons(x, R))
```

- Check that Inv is preserved by the loop body:

```
{ { Inv: rev-acc(S0, R0) = rev-acc(S, R) } }
while (S != nil) {
    { { rev-acc(S0, R0) = rev-acc(S, R) and S ≠ nil } }
    R = cons(S.hd, R);
    S = S.tl;
    { { rev-acc(S0, R0) = rev-acc(S, R) } }
}
```

“Top Down” List Loop

```
func rev-acc(nil, R)           := R
    rev-acc(cons(x, L), R)  := rev-acc(L, cons(x, R))
```

- Check that Inv is preserved by the loop body:

```
{ { Inv: rev-acc(S0, R0) = rev-acc(S, R) } }
while (S != nil) {
    { { rev-acc(S0, R0) = rev-acc(S, R) and S ≠ nil } }
    R = cons(S.hd, R);
    ↑ { { rev-acc(S0, R0) = rev-acc(S.tl, R) } }
    S = S.tl;
    { { rev-acc(S0, R0) = rev-acc(S, R) } }
}
```

“Top Down” List Loop

```
func rev-acc(nil, R)           := R
    rev-acc(cons(x, L), R)  := rev-acc(L, cons(x, R))
```

- Check that Inv is preserved by the loop body:

```
{ { Inv: rev-acc(S0, R0) = rev-acc(S, R) } }
while (S != nil) {
    { { rev-acc(S0, R0) = rev-acc(S, R) and S ≠ nil } }
    { { rev-acc(S0, R0) = rev-acc(S.tl, cons(S.hd, R)) } }
    R = cons(S.hd, R);
    { { rev-acc(S0, R0) = rev-acc(S.tl, R) } }
    S = S.tl;
    { { rev-acc(S0, R0) = rev-acc(S, R) } }
}
```

“Top Down” List Loop

```
func rev-acc(nil, R)           := R
    rev-acc(cons(x, L), R)  := rev-acc(L, cons(x, R))
```

- Check that Inv is preserved by the loop body:

$\{\{ \text{rev-acc}(S_0, R_0) = \text{rev-acc}(S, R) \text{ and } S \neq \text{nil} \}\}$
 $\{\{ \text{rev-acc}(S_0, R_0) = \text{rev-acc}(S.\text{tl}, \text{cons}(S.\text{hd}, R)) \}\}$

$\text{rev-acc}(S.\text{tl}, \text{cons}(S.\text{hd}, R))$
= $\text{rev-acc}(\text{cons}(S.\text{hd}, S.\text{tl}), R)$
= $\text{rev-acc}(S, R)$
= $\text{rev-acc}(S_0, R_0)$

def of rev-acc
since $S \neq \text{nil}$
since $\text{rev-acc}(S, R) = \text{rev-acc}(S_0, R_0)$

Tail Recursion Elimination

- Most functional languages eliminate tail recursion
 - acts like a loop at run-time
 - true of JavaScript as well
- Alternatives for reducing space usage:
 1. Find a loop that implements it
 - check correctness with Floyd logic
 2. Find an equivalent tail-recursive function
 - check equivalence with structural induction
