## CSE 331

Arrays
James Wilcox \& Kevin Zatloukal

## Recall: Turning Recursion Into a Loop

- Saw templates for structural recursion on
- natural numbers
- lists
straightforward
harder
- Special case for tail recursion on
- lists
straightforward

## Processing Lists with Loops

- Hard to process lists with loops
- only have easy access to the last element added natural processing would start from the other end
- must reverse the list to work "bottom up" that requires an additional $O(n)$ space
- There is an easier way to fix this...
- switch data structures
- use one that lets us access either end easily
"Lists are the original data structure for functional programming, just as arrays are the original data structure of imperative programming"

Ravi Sethi

## Array Accesses

- Easily access both $\mathrm{A}[0]$ and $\mathrm{A}[\mathrm{n}-1]$, where $\mathrm{n}=$ A.length
- bottom-up loops are now easy
- "With great power, comes great responsibility"
- the Peter Parker Principle
- Whenever we write "A[j]", we must check $0 \leq \mathrm{j}<\mathrm{n}$
- new bug just dropped!
with list, we only need to worry about nil and non-nil once we know $L$ is non-nil, we know L.hd exists
- TypeScript will not help us with this!
type checker does catch "could be nil" bugs, but not this

## Correctness Levels

| Description | Testing | Tools | Reasoning |
| :---: | :---: | :---: | :---: |
| small \# of inputs | exhaustive |  |  |
| straight from spec | heuristics | type checking | code reviews |
| no mutation | " | libraries | calculation <br> induction |
| local variable mutation | " | " | Floyd logic |
| array mutation | " | " | for-any facts |
| heap state mutation | " |  | ? |

## Array Math

- Easily access both $\mathrm{A}[0]$ and $\mathrm{A}[\mathrm{n}-1]$, where $\mathrm{n}=$ A.length
- bottom-up loops are now easy
- "With great power, comes great responsibility"
- the Peter Parker Principle
- Will need new tools for reasoning about arrays
- will start with new math for describing them

## Array Literals

- Write array values in math like this:

$$
A:=[1,2,3] \quad \text { (with } A: \text { Array }_{\mathbb{Z}} \text { ) }
$$

- the empty array is "[]"
- Array literal syntax is the same in TypeScript:

```
const A: Array<bigint> = [1n, 2n, 3n];
const B: bigint[] = [4n, 5n];
```

- can write Array $_{\mathbb{Z}}$ as "Array<bigint>" or"bigint []"

## Array Concatenation

- Define the operation "\#" as array concatenation
- makes clear the arguments are arrays, not numbers
- The following properties hold for any arrays $\mathrm{A}, \mathrm{B}, \mathrm{C}$

$$
\begin{align*}
& A+[]=A=[]+A  \tag{"identity"}\\
& A+(B+C)=(A+B)+C
\end{align*}
$$

("associativity")

- we will use these facts without explanation in calculations
- second line says parentheses don't matter, so we will write A \# B + C and not say where the (..) go

## Array Concatenation Math

- Same properties hold for lists
[]$+\mathrm{A}=\mathrm{A}$
$\mathrm{A}+[]=\mathrm{A}$
$A+(B+C)=(A+B)+C$
concat (A, concat(B, C))
$=\operatorname{concat}(\operatorname{concat}(\mathrm{A}, \mathrm{B}), \mathrm{C})$
- we required explanation of these facts for lists
- but we will not require explanation of these facts for arrays
(trying to reason more quickly, now that we have more practice)

## Defining Functions on Arrays

- Can still define functions recursively

$$
\begin{aligned}
\text { func } \operatorname{sum}([]) \quad & :=0 \\
\operatorname{sum}(A+[y]) & :=\operatorname{sum}(A)+y \quad \text { for any } y: \mathbb{Z} \text { and } A: \operatorname{Array}_{\mathbb{Z}}
\end{aligned}
$$

- could write patterns with "[y] \# A" instead

## Subarrays

- Often useful to talk about part of an array (subarray)
- define the following notation

$$
A[i . . j]=[A[i], A[i+1], \ldots, A[j]]
$$

- note that this includes $A[j]$
(some functions exclude the right end; we will include it)

## Subarrays

$$
A[i . . j]=[A[i], A[i+1], \ldots, A[j]]
$$

- Define this formally as follows

$$
\begin{aligned}
\text { func } A[i . . j] & :=[] & \text { if } j<i \\
A[i . . j] & :=A[i . . j-1]+[A[j]] & \text { if } i \leq j
\end{aligned}
$$

- second case needs $0 \leq \mathrm{j}<\mathrm{n}$ for this to make sense
$A[\mathrm{i} . . \mathrm{j}]$ is undefined if $\mathrm{i} \leq \mathrm{j}$ and $(\mathrm{i}<0$ or $\mathrm{n} \leq \mathrm{j})$
- note that $A[0 . .-1]=[]$ since $-1<0$
"Isn't -1 an array out of bounds error?"
In code, yes - In math, no
(the definition says this is an empty array)

## Subarray Math

$$
\begin{array}{rll}
\text { func } A[i . . j] & :=[] & \text { if } \mathrm{j}<\mathrm{i} \\
A[\mathrm{i} . . j] & :=A[\mathrm{i} . . \mathrm{j}-1]+[A[j]] & \\
A[\mathrm{if} 0 \leq \mathrm{i} \leq \mathrm{j}<\mathrm{j}] & :=\text { undefined } & \\
\text { if } \mathrm{i} \leq \mathrm{j} \text { and }(\mathrm{i}<0 \text { or A.length } \leq \mathrm{j})
\end{array}
$$

- Some useful facts

$$
\mathrm{A}=\mathrm{A}[0 . . \mathrm{n}-1] \quad(=[\mathrm{A}[0], \mathrm{A}[1], \ldots, \mathrm{A}[\mathrm{n}-1]])
$$

where $\mathrm{n}=$ A.length

- the subarray from 0 to $n-1$ is the entire array

$$
A[i . . j]=A[i . . k]+A[k+1 . . j]
$$

- holds for any $\mathrm{i}, \mathrm{j}, \mathrm{k}: \mathbb{N}$ satisfying $\mathrm{i}-1 \leq \mathrm{k} \leq \mathrm{j}$ (and $0 \leq \mathrm{i} \leq \mathrm{j}<\mathrm{n}$ )
- we will use these without explanation

## TypeScript Arrays

- Translating math to TypeScript

$$
\begin{array}{ll}
\text { Math } & \text { TypeScript } \\
A+B & \text { A.concat (B) } \\
A[i . . j] & \text { A.slice }(i, j+1)
\end{array}
$$

- JavaScript's A.slice (i, j) does not include A[j], so we need to increase $j$ by one
- Note: array out of bounds does not throw Error
- returns undefined
(hope you like debugging!)

## Facts About Arrays

- "With great power, comes great responsibility"
- Since we can easily access any $\mathrm{A}[\mathrm{j}]$, may need to keep track of facts about it
- may need facts about every element in the array
applies to preconditions, postconditions, and intermediate assertions
- We can write facts about several elements at once:
- this says that elements at indexes 2 .. 10 are non-negative

$$
0 \leq \mathrm{A}[\mathrm{j}] \text { for any } 2 \leq \mathrm{j} \leq 10
$$

- shorthand for 9 facts $(0 \leq \mathrm{A}[2], \ldots, 0 \leq \mathrm{A}[10])$

## Finding an Element in an Array

- Can search for an element in an array as follows

| func contains $([], x)$ | $:=F$ |  | for any $\ldots$ |
| :---: | :--- | :--- | :--- |
| contains $(A+[y], x)$ | $:=T$ | if $x=y$ | for any $\ldots$ |
| contains $(A+[y], x)$ | $:=\operatorname{contains(A,x)}$ | if $x \neq y$ | for any $\ldots$ |

- Searches through the array in linear time
- did the same on lists
- Can search more quickly if the list is sorted
- precondition is $\mathrm{A}[0] \leq \mathrm{A}[1] \leq \ldots \leq \mathrm{A}[\mathrm{n}-1] \quad$ (informal)
- write this formally as

$$
A[j] \leq A[j+1] \text { for any } 0 \leq \mathrm{j} \leq \mathrm{n}-2
$$

## Loops with Arrays

## Sum of an Array

$$
\begin{aligned}
\text { func } \operatorname{sum}([]) & :=0 \\
\operatorname{sum}(A+[y]) & :=\operatorname{sum}(A)+y \quad \text { for any } y: \mathbb{Z} \text { and } A: \operatorname{Array}_{\mathbb{Z}}
\end{aligned}
$$

- Could translate this directly into a recursive function
- that would be straight from the spec
- Do this instead with a loop. Loop idea...
- use the "bottom up" approach
- start from [] and work up to all of A
- at any point, we have sum(A[0 .. $j-1])$ for some index $j$

I will add one extra fact we also need

## Sum of an Array

$$
\begin{aligned}
\text { func } \operatorname{sum}([]) & :=0 \\
\operatorname{sum}(A+[y]) & :=\operatorname{sum}(A)+y \quad \text { for any } y: \mathbb{Z} \text { and } A: \operatorname{Array}_{\mathbb{Z}}
\end{aligned}
$$

- Loop implementation:

```
let j: bigint = 0n;
let s: bigint = 0n;
{{Inv: s = sum(A[0 .. j - 1]) and 0\leq j m A.length }}
while (j < A.length) {
    s = s + A[j];
    j = j + 1n; could write"j !== A.length"
}
{{s=\operatorname{sum}(A)}}
return s;
```

## Sum of an Array

$$
\begin{aligned}
\text { func } \operatorname{sum}([]) \quad & :=0 \\
\operatorname{sum}(A+[y]) & :=\operatorname{sum}(A)+y \quad \text { for any } y: \mathbb{Z} \text { and } A: A r r a y_{\mathbb{Z}}
\end{aligned}
$$

- Loop implementation:

```
| let j: bigint \(=0 n\);
let \(s:\) bigint \(=0 n ;\)
\(\{\{\mathrm{j}=0\) and \(\mathrm{s}=0\}\}\)
\(\{\{\) Inv: \(\mathrm{s}=\operatorname{sum}(\mathrm{A}[0 \mathrm{n} \mathrm{j}-1])\) and \(0 \leq \mathrm{j} \leq\) A.length \(\}\}]\)
while (j < A.length) \{
    \(s=s+A[j] ;\)
    \(j=j+1 n ;\)
\}
\(\{\{\mathrm{s}=\operatorname{sum}(\mathrm{A})\}\}\)
return \(s\);
```

## Sum of an Array

$$
\begin{aligned}
\text { func } \operatorname{sum}([]) & :=0 \\
\operatorname{sum}(A+[y]) & :=\operatorname{sum}(A)+y \quad \text { for any } y: \mathbb{Z} \text { and } A: \operatorname{Array}_{\mathbb{Z}}
\end{aligned}
$$

- Loop implementation:

```
| let j: bigint \(=0 n\);
let \(s:\) bigint \(=0 n ;\)
\(\{\{\mathrm{j}=0\) and \(\mathrm{s}=0\}\}\)
\(\{\{\) Inv: \(\mathrm{s}=\operatorname{sum}(\mathrm{A}[0 \mathrm{I} \mathrm{j}-1])\) and \(0 \leq \mathrm{j} \leq\) A.length \(\}\}]\)
while (j < A.length) \{
    \(s=s+A[j] ;\)
    \(j=j+1 n ;\)
\}
\(\{\{\mathrm{s}=\operatorname{sum}(\mathrm{A})\}\}\)
return \(s\);
```

```
\(\mathrm{s}=0\)
```

$\mathrm{s}=0$
$=\operatorname{sum}([]) \quad$ def of sum
$=\operatorname{sum}([]) \quad$ def of sum
$=\operatorname{sum}(A[0 . .-1])$
$=\operatorname{sum}(A[0 . .-1])$
$=\operatorname{sum}(A[0 . . j-1]) \quad$ since $j=0$
$=\operatorname{sum}(A[0 . . j-1]) \quad$ since $j=0$
$\mathrm{j}=0$
$\mathrm{j}=0$
$\leq$ A.length

```
    \(\leq\) A.length
```

## Sum of an Array

$$
\begin{aligned}
\text { func } \operatorname{sum}([]) & :=0 \\
\operatorname{sum}(A+[y]) & :=\operatorname{sum}(A)+y \quad \text { for any } y: \mathbb{Z} \text { and } A: \operatorname{Array}_{\mathbb{Z}}
\end{aligned}
$$

- Loop implementation:

```
let j: bigint = 0n;
let s: bigint = 0n;
{{Inv: s = sum(A[0 ..j - 1]) and 0\leqj < A.length }}
while (j < A.length) {
    s = s + A[j];
    j = j + 1n;
}
{{s=\operatorname{sum(A[0 ..j - 1]) and j = A.length }}}}{\begin{array}{l}{{{s=\operatorname{sum(A) }}}}
return s;
```

## Sum of an Array

$$
\begin{aligned}
\text { func } \operatorname{sum}([]) & :=0 \\
\operatorname{sum}(A+[y]) & :=\operatorname{sum}(A)+y \quad \text { for any } y: \mathbb{Z} \text { and } A: \operatorname{Array}_{\mathbb{Z}}
\end{aligned}
$$

- Loop implementation:

```
let j: bigint = 0n;
let s: bigint = 0n;
{{Inv: s = sum(A[0 ..j - 1]) and 0\leqj < A.length }}
while (j < A.length) {
    s = s + A[j];
    j = j + 1n;
}
{{s=\operatorname{sum}(A[0 .. j - 1]) and j = A.length }} ] s = sum(A[0 ..j-1])
{{s=\operatorname{sum}(A)}}
return s;
```

```
    = sum(A[0 .. A.length - 1])
```

    = sum(A[0 .. A.length - 1])
    = sum(A)
    ```
    = sum(A)
```

## Sum of an Array

$$
\begin{aligned}
\text { func } \operatorname{sum}([]) & :=0 \\
\operatorname{sum}(A+[y]) & :=\operatorname{sum}(A)+y \quad \text { for any } y: \mathbb{Z} \text { and } A: \operatorname{Array}_{\mathbb{Z}}
\end{aligned}
$$

- Loop implementation:

```
let j: bigint = 0n;
let s: bigint = 0n;
{{Inv: s = sum(A[0 ..j - 1]) and 0\leqj < A.length }}
while (j < A.length) {
    {{s=\operatorname{sum}(A[0 .. j - 1]) and 0\leqj<A.length }}
    s = s + A[j];
    j = j + 1n;
    {{s=\operatorname{sum}(A[0 .. j - 1]) and 0\leqj\leq A.length }}
}
{{s=\operatorname{sum}(A) }}
return s;
```

## Sum of an Array

$$
\begin{aligned}
\text { func } \operatorname{sum}([]) & :=0 \\
\operatorname{sum}(A+[y]) & :=\operatorname{sum}(A)+y \quad \text { for any } y: \mathbb{Z} \text { and } A: \operatorname{Array}_{\mathbb{Z}}
\end{aligned}
$$

- Loop implementation:

$$
\begin{aligned}
& \text { while }(j<A . l e n g t h) \quad\{ \\
& \quad\{\{s=\operatorname{sum}(A[0 . . j-1]) \text { and } 0 \leq j<\text { A.length }\}\} \\
& s=s+A[j] ; \\
& \{\{s-A[j]=\operatorname{sum}(A[0 . . j-1]) \text { and } 0 \leq j<A . l e n g t h\}\} \\
& j=j+1 n ; \\
& \{\{s=\operatorname{sum}(A[0 . . j-1]) \text { and } 0 \leq j \leq \text { A.length }\}\}
\end{aligned}
$$

## Sum of an Array

$$
\begin{aligned}
\text { func } \operatorname{sum}([]) \quad & :=0 \\
\operatorname{sum}(A+[y]) & :=\operatorname{sum}(A)+y \quad \text { for any } y: \mathbb{Z} \text { and } A: A r r a y_{\mathbb{Z}}
\end{aligned}
$$

- Loop implementation:

$$
\begin{aligned}
& \text { while }(j<A . l e n g t h) \quad\{ \\
& \quad\{\{s=\operatorname{sum}(A[0 . . j-1]) \text { and } 0 \leq j<\text { A.length }\}\} \\
& \quad s=s+A[j] ; \\
& \{\{s-A[j]=\operatorname{sum}(A[0 . . j-1]) \text { and } 0 \leq j<A . l e n g t h ~\}\} \\
& j=j+1 n ; \\
& \\
& \{\{s-A[j-1]=\operatorname{sum}(A[0 . . j-2]) \text { and } 0 \leq j-1<\text { A.length }\}\} \\
& \{\{s=\operatorname{sum}(A[0 . . j-1]) \text { and } 0 \leq j \leq \text { A.length }\}\}
\end{aligned}
$$

## Sum of an Array

$$
\begin{aligned}
\text { func } \operatorname{sum}([]) & :=0 \\
\operatorname{sum}(A+[y]) & :=\operatorname{sum}(A)+y \quad \text { for any } y: \mathbb{Z} \text { and } A: \operatorname{Array}_{\mathbb{Z}}
\end{aligned}
$$

- Loop implementation:

$$
\begin{aligned}
& \text { while (j < A.length) \{ } \\
& \{\{\mathrm{s}=\operatorname{sum}(\mathrm{A}[0 \mathrm{n} . \mathrm{j}-1]) \text { and } 0 \leq \mathrm{j}<\text { A.length }\}\} \\
& \mathrm{s}=\mathrm{s}+\mathrm{A}[\mathrm{j}] \text {; } \\
& \{\{s-A[j]=\operatorname{sum}(A[0 . . j-1]) \text { and } 0 \leq j<A . l e n g t h ~\}\} \\
& j=j+1 n ; \\
& \{\{s-A[j-1]=\operatorname{sum}(A[0 . . j-2]) \text { and } 0 \leq j-1<\text { A.length }\}\} \\
& \{\{\mathrm{s}=\operatorname{sum}(\mathrm{A}[0 . . \mathrm{j}-1]) \text { and } 0 \leq \mathrm{j} \leq \text { A.length }\}\} \\
& \text { \} } \\
& s=\operatorname{sum}(A[0 . . j-2])+A[j-1] \quad \text { since } s-A[j-1]=\operatorname{sum}(. .) \\
& =\operatorname{sum}(A[0 . . j-2]+[A[j-1]]) \quad \text { def of sum } \\
& =\operatorname{sum}(A[0 . . j-1])
\end{aligned}
$$

## Recursion versus Loops

- There is a fundamental tension between:
- Natural recursive order (bottom-up, aka back-to-front)
- Natural loop order (front-to-back)
- Three ways to bridge this gap:
- Make the loop serve the recursion

Bottom-up list loop template calling rev(L)

- Make the recursion serve the loop

Tail recursion

- Change the data structure

Arrays

## Recursion versus Loops

- Three ways to bridge this gap:
- Make the loop serve the recursion

$$
\begin{aligned}
\text { func } \operatorname{sum}(\text { nil }) & :=0 \\
\quad \operatorname{sum}(\operatorname{cons}(x, L)) & :=x+\operatorname{sum}(L) \quad \text { for any } x: \mathbb{Z} \text { and } \mathrm{L}: \text { List }
\end{aligned}
$$

- Make the recursion serve the loop

```
func sum-acc(nil, s) := s
    sum-acc(cons(x,L), s):= sum-acc(L,x+s) for any x : \mathbb{Z and L : List}
```

- Change the data structure

$$
\begin{aligned}
\text { func } \operatorname{sum}([]) \quad & :=0 \\
\quad \operatorname{sum}(A+[y]) & :=\operatorname{sum}(A)+y \quad \text { for any } y: \mathbb{Z} \text { and } A: \operatorname{Array}_{\mathbb{Z}}
\end{aligned}
$$

## Linear Search of an Array

$$
\begin{array}{cll}
\text { func contains }([], x) & :=F & \\
\operatorname{contains}(A+[y], x) & :=T & \text { if } x=y \\
\operatorname{contains}(A+[y], x) & :=\operatorname{contains}(A, x) & \text { if } x \neq y
\end{array}
$$

- Could translate this directly into a recursive function
- that would be straight from the spec
- Do this instead with a loop. Loop idea...
- use the "bottom up" template
- start from [] and work up to all of A
- but we can stop immediately if we find $x$ contains returns true in that case
- otherwise, we have contains $(A[0$.. $j-1], x)=F$ for some $j$

## Linear Search of an Array

$$
\begin{array}{cll}
\text { func contains }([], x) & :=F & \\
\text { contains }(A+[y], x) & :=T & \text { if } x=y \\
\operatorname{contains}(A+[y], x) & :=\operatorname{contains}(A, x) & \text { if } x \neq y
\end{array}
$$

- Loop implementation:

```
let j: bigint = 0n;
{{ Inv: contains(A[0 .. j-1], x) = F and 0 \leq j \leq A.length }}
while (j < A.length) {
    if (A[j] === x)
        {{ contains(A, x) = T }}
        return true;
    j = j + 1n;
}
{{\operatorname{contains(A, x) = F }}}
return false;
```

## Linear Search of an Array

$$
\begin{array}{cll}
\text { func contains }([], x) & :=F & \\
\operatorname{contains}(A+[y], x) & :=T & \text { if } x=y \\
\operatorname{contains}(A+[y], x) & :=\operatorname{contains}(A, x) & \text { if } x \neq y
\end{array}
$$

- Loop implementation:

```
\(\downarrow\) let j: bigint \(=0 n\);
\(\left.\begin{array}{l}\{\{\mathrm{j}=0\}\} \\ \{\{\text { Inv: contains }(\mathrm{A}[0 . . \mathrm{j}-1], \mathrm{x})=\mathrm{F} \text { and } 0 \leq \mathrm{j} \leq \text { A.length }\}\}\end{array}\right]\)
while (j < A.length) \{
    if ( \(\mathrm{A}[\mathrm{j}]===\mathrm{x}\) )
        return true;
    \(j=j+1 n ;\)
\}
return false;
```

## Linear Search of an Array

$$
\begin{array}{cll}
\text { func contains }([], x) & :=F & \\
\text { contains }(A+[y], x) & :=T & \text { if } x=y \\
\operatorname{contains}(A+[y], x) & :=\operatorname{contains}(A, x) & \text { if } x \neq y
\end{array}
$$

- Loop implementation:

```
\(\downarrow\) let j: bigint \(=0 n\);
\(\{\{\mathrm{j}=0\}\}\)
\(\{\{\) Inv: contains \((A[0 . . j-1], x)=F\) and \(0 \leq j \leq\) A.length \(\}\}\)
while (j < A.length) \{
    if ( \(\mathrm{A}[\mathrm{j}]===\mathrm{x}\) )
        return true; contains(A[0..j-1], x)
    \(j=j+1 n ; \quad=\operatorname{contains}(A[0 \ldots-1], x) \quad\) since \(j=0\)
\}
return false;
```

```
    = contains([],x)
```

    = contains([],x)
    = F
    = F
        def of contains
    ```
        def of contains
```

    \(0 \leq 0=\mathrm{j} \quad\) and \(\quad \mathrm{j}=0 \leq\) A.length
    
## Linear Search of an Array

$$
\begin{array}{cll}
\text { func contains }([], x) & :=F & \\
\operatorname{contains}(A+[y], x) & :=T & \text { if } x=y \\
\operatorname{contains}(A+[y], x) & :=\operatorname{contains}(A, x) & \text { if } x \neq y
\end{array}
$$

- Loop implementation:

```
let j: bigint = 0n;
{{Inv: contains(A[0 .. j-1], x) = F and 0 \leq j m A.length }}
while (j < A.length) {
    if (A[j] === x)
        return true;
    j = j + 1n;
}
{{ contains(A[0 .. j-1], x) = F and j = A.length }}
{{ contains(A,x)=F }}
return false;
```

## Linear Search of an Array

$$
\begin{array}{cll}
\text { func contains }([], x) & :=F & \\
\text { contains }(A+[y], x) & :=T & \text { if } x=y \\
\operatorname{contains}(A+[y], x) & :=\operatorname{contains}(A, x) & \text { if } x \neq y
\end{array}
$$

- Loop implementation:

```
let j: bigint = 0n;
{{Inv: contains(A[0 .. j-1], x) = F and 0 \leq j m A.length }}
while (j < A.length) {
    if (A[j] === x)
        return true; F = contains(A[0 .. j-1],x)
    j = j + 1n; = contains(A, x)
}
{{ contains(A[0 .. j-1], x) = F and j = A.length }}
{{ contains(A,x)=F }}
```

return false;

## Linear Search of an Array

$$
\begin{array}{cll}
\text { func contains }([], x) & :=F & \\
\text { contains }(A+[y], x) & :=T & \text { if } x=y \\
\operatorname{contains}(A+[y], x) & :=\operatorname{contains}(A, x) & \text { if } x \neq y
\end{array}
$$

- Loop implementation:

```
while (j < A.length) {
    {{ contains(A[0 .. j-1], x) = F and 0 \leq j < A.length }}
    if (A[j] === x)
        {{ contains(A, x) = T }}
        return true;
    j = j + 1n;
    {{ contains(A[0 .. j-1],x) = F and 0 \leq j \leq A.length }}
}
return false;
```

## Linear Search of an Array

$$
\begin{array}{cll}
\text { func contains }([], x) & :=F & \\
\operatorname{contains}(A+[y], x) & :=T & \text { if } x=y \\
\operatorname{contains}(A+[y], x) & :=\operatorname{contains}(A, x) & \text { if } x \neq y
\end{array}
$$

- Loop implementation:

```
{{ contains(A[0 .. j-1],x) = F and 0 \leq j < A.length }}
if (A[j] === x) {
    {{ contains(A, x)=T }}
    return true;
} else {
}
j = j + 1n;
{{ contains(A[0 .. j-1],x) = F and 0 \leq j \leq A.length }}
```

## Linear Search of an Array

$$
\begin{array}{cll}
\text { func contains }([], x) & :=F & \\
\operatorname{contains}(A+[y], x) & :=T & \text { if } x=y \\
\operatorname{contains}(A+[y], x) & :=\operatorname{contains}(A, x) & \text { if } x \neq y
\end{array}
$$

- Loop implementation:

```
    {{ contains(A[0 .. j-1], x) = F and 0 \leq j < A.length }}
    if (A[j] === x) {
    &{{ contains(A[0 .. j-1], x)=F and 0 \leq j < A.length and A[j] = x }}
    {{ contains(A, x)= T }}
    return true;
    } else {
```

## Linear Search of an Array

$$
\begin{array}{cll}
\text { func contains }([], x) & :=F & \\
\operatorname{contains}(A+[y], x) & :=T & \text { if } x=y \\
\operatorname{contains}(A+[y], x) & :=\operatorname{contains}(A, x) & \text { if } x \neq y
\end{array}
$$

- Loop implementation:

```
    \(\{\{\) contains \((\mathrm{A}[0 \mathrm{n} . \mathrm{j}-1], \mathrm{x})=\mathrm{F}\) and \(0 \leq \mathrm{j}<\) A.length \(\}\}\)
if (A[j] === x) \{
    \(\{\{\) contains \((A[0 . . j-1], x)=F\) and \(0 \leq j<A\).length and \(A[j]=x\}\}\)
    \(\{\{\) contains \((\mathrm{A}, \mathrm{x})=\mathrm{T}\}\}\)
    return true;
    \} else \{
contains \((A[0 . . j], x)\)
\(=\operatorname{contains}(A[0 . . j-1]+[A[j]], x)\)
\(=T\)\(\quad\) since \(A[j]=x \quad l y\)
```

Can now prove by induction that contains $(\mathrm{A}, \mathrm{x})=\mathrm{T}$

## Linear Search of an Array

$$
\begin{array}{cll}
\text { func contains }([], x) & :=F & \\
\operatorname{contains}(A+[y], x) & :=T & \text { if } x=y \\
\operatorname{contains}(A+[y], x) & :=\operatorname{contains}(A, x) & \text { if } x \neq y
\end{array}
$$

- Loop implementation:

```
    {{ contains(A[0 .. j-1], x) = F and j < A.length }}
    if (A[j] === x) {
    return true;
} else {
```

```
    ->{{ contains(A[0 .. j],x) = F and 0\leqj+1 \leq A.length }}
    }
    {{ contains(A[0 .. j], x) = F and 0 \leq j+1 \leq A.length }}
    j = j + 1;
    {{ contains(A[0 .. j-1],x) = F and 0 \leq j \leq A.length }}
```

## Linear Search of an Array

$$
\begin{array}{cll}
\text { func contains }([], x) & :=F & \\
\text { contains }(A+[y], x) & :=T & \text { if } x=y \\
\operatorname{contains}(A+[y], x) & :=\operatorname{contains}(A, x) & \text { if } x \neq y
\end{array}
$$

- Loop implementation:

```
\(\{\{\) contains \((A[0 . . j-1], x)=F\) and \(j<\) A.length \(\}\}\)
if (A[j] === x) \{
    return true;
\} else \{
    \(\{\{\operatorname{contains}(A[0 . . j-1], x)=F\) and \(0 \leq j<A\).length and \(A[j] \neq x\}\}\)
    \(\{\{\) contains \((\mathrm{A}[0 \mathrm{oj} \mathrm{j}], \mathrm{x})=\mathrm{F}\) and \(0 \leq \mathrm{j}+1 \leq\) A.length \(\}\}\)
\}
```

## Linear Search of an Array

$$
\begin{array}{cll}
\text { func contains }([], x) & :=F & \\
\text { contains }(A+[y], x) & :=T & \text { if } x=y \\
\operatorname{contains}(A+[y], x) & :=\operatorname{contains}(A, x) & \text { if } x \neq y
\end{array}
$$

- Loop implementation:

```
\(\{\{\) contains \((A[0 . . j-1], x)=F\) and \(j<\) A.length \(\}\}\)
if (A[j] === x) \{
    return true;
\} else \{
    \(\{\{\operatorname{contains}(A[0 . . j-1], x)=F\) and \(0 \leq j<A\).length and \(A[j] \neq x\}\}\)
    \(\{\{\) contains \((A[0 . . j], x)=F\) and \(0 \leq j+1 \leq\) A.length \(\}\}\)
\}
```

```
\(F=\) contains \((A[0 . . j-1], x)\)
```

$F=$ contains $(A[0 . . j-1], x)$
$=$ contains $(A[0 . . j-1]+[A[j]], x) \quad$ def of contains (since $A[j] \neq x)$
$=$ contains $(A[0 . . j-1]+[A[j]], x) \quad$ def of contains (since $A[j] \neq x)$
$=$ contains (A[0 .. j], x)

```
    \(=\) contains (A[0 .. j], x)
```

## Loop Invariants with Arrays

- Saw two more examples previously

$$
\begin{array}{ll}
\{\{\text { Inv: } s=\operatorname{sum}(\mathrm{A}[0 . . j-1]) \ldots\}\} & \text { sum of array } \\
\{\{\text { Post: } s=\operatorname{sum}(\mathrm{A}[0 . . \mathrm{n}-1])\}\} & \\
& \{\{\text { Inv: contains }(\mathrm{A}[0 . . j-1], \mathrm{x})=\mathrm{F} . . .\}\} \\
\{\{\text { Post: contains }(\mathrm{A}[0 . . \mathrm{n}-1], \mathrm{x})=\mathrm{F}\}\} & \text { search an arr }
\end{array}
$$

- in both cases, Post is a special case of Inv (where $j=n$ )
- in other words, Inv is a weakening of Post
- Heuristic for loop invariants: weaken the postcondition
- assertion that allows postcondition as a special case
- must also allow states that are easy to prepare

## Heuristic for Loop Invariants

- Loop Invariant allows both start and stop states
- describing more states = weakening

```
{{P }}
{{ Inv: I }}
while (cond) {
    S
}
{{Q }}
```

- usually are many ways to weaken it...

## Searching a Sorted Array

- Suppose we require A to be sorted:
- precondition includes

$$
\mathrm{A}[\mathrm{j}-1] \leq \mathrm{A}[\mathrm{j}] \text { for any } 1 \leq \mathrm{j}<\mathrm{n} \quad \text { (where } \mathrm{n}:=\text { A.length) }
$$

- Want to find the index k where " x " would be...
- picture would look like this:

## Aside: Array Facts as Pictures

- Can use pictures to write array facts concisely
- one thing that whiteboard in your office is good for
- Example above encodes several facts:
$-A[j]<x$ for any $0 \leq j<k$
$-\mathrm{x} \leq \mathrm{A}[\mathrm{j}]$ for any $\mathrm{k} \leq \mathrm{j}<\mathrm{n}$
- $0 \leq \mathrm{k} \leq \mathrm{n}$

## Searching a Sorted Array

0
k

- End with complete knowledge of $\mathrm{A}[\mathrm{j}]$ vs x
- how can we describe partial knowledge?
- Recall: loop for contains
- postcondition says to return contains( $\mathrm{A}, \mathrm{x}$ )
- but we exit loop knowing contains $(\mathrm{A}, \mathrm{x})=\mathrm{F}$

## Searching a Sorted Array

- End with complete knowledge of $\mathrm{A}[\mathrm{j}]$ vs x
- how can we describe partial knowledge?
- we will focus on the elements that are smaller than x
$\square$

## Searching a Sorted Array

- End with complete knowledge of $\mathrm{A}[\mathrm{j}]$ vs x
- how can we describe partial knowledge?

- Loop idea... increase k until we hit $\mathrm{x} \leq \mathrm{A}[\mathrm{k}]$

## Searching a Sorted Array

```
// @returns true if A[j] = x for some 0<= j < n
// false if A[j] != x for any 0<= j < n
```

- Loop implementation:

```
let k: bigint = 0n;
{{ Inv: A[j]< x for any 0\leqj< k and 0\leqk n n }}
while (k < A.length && A[k] <= x) {
    if (A[k] === x) {
        return true;
    } else {
        k = k + 1n;
    }
}
return false;
```

## Searching a Sorted Array

```
let \(k:\) bigint \(=0 n\);
\(\{\{\mathrm{k}=0\}\}\)
\(\{\{\) Inv: \(\mathrm{A}[\mathrm{j}]<\mathrm{x}\) for any \(0 \leq \mathrm{j}<\mathrm{k}\) and \(0 \leq \mathrm{k} \leq \mathrm{n}\}\}\) ]
while ( \(k\) < A.length \&\& \(A[k]<=x\) ) \{
    if (A[k] === x) \{
        return true;
    \} else \{
        \(\mathrm{k}=\mathrm{k}+1 \mathrm{n} ;\)
    \}
\}
return false;
```

What is the claim when $\mathrm{k}=0$ ?

$$
A[j]<x \text { for any } 0 \leq j<0
$$

What values of j satisfy $0 \leq \mathrm{j}<0$ ?
None. Nothing is claimed.

Statement is (vacuously) true when $\mathrm{k}=0$

With "for any" facts, we need to think about exactly what facts are being claimed.

## Searching a Sorted Array

```
    let \(k:\) bigint \(=0 n\);
    \(\{\{\) Inv: \(\mathrm{A}[\mathrm{j}]<\mathrm{x}\) for any \(0 \leq \mathrm{j}<\mathrm{k}\) and \(0 \leq \mathrm{k} \leq \mathrm{n}\}\}\)
    while ( \(k<A . l e n g t h ~ \& \& A[k]<=x)\) \{
        if (A[k] === x) \{
        return true;
    \} else \{
        \(\mathrm{k}=\mathrm{k}+1 \mathrm{n} ;\)
    \}
\}
\(\{\{\mathrm{A}[\mathrm{j}]<\mathrm{x}\) for any \(0 \leq \mathrm{j}<\mathrm{k}\) and \((\mathrm{k}=\mathrm{n}\) or \(\mathrm{A}[\mathrm{k}]>\mathrm{x})\}\}\)
\(\{\{\mathrm{A}[\mathrm{j}] \neq \mathrm{x}\) for any \(0 \leq \mathrm{j}<\mathrm{n}\}\}\)
return false;
```

Top assertion has an "or", so we argue by cases.

## Searching a Sorted Array

$$
\left.\begin{array}{l}
\text { while }(k<A . l e n g t h \& \& A[k]<=x)\{ \\
\quad \text { if }(A[k]===x)\{ \\
\quad \text { return true; } \\
\} \text { else }\{ \\
\quad k=k+1 n ; \\
\}
\end{array}\right\} \begin{aligned}
& \left\{\begin{array}{l}
\{A[j]<x \text { for any } 0 \leq j<k \text { and }(k=n \text { or } A[k]>x)\}\} \\
\{\{A[j] \neq x \text { for any } 0 \leq j<n\}\} \\
\text { return false; }
\end{array}\right.
\end{aligned}
$$

Case $\mathrm{k}=\mathrm{n}$ ( $=$ A.length):
Know that $A[j]<x$ for any $0 \leq j<n \quad($ since $k=n)$
This means $A[j] \neq x$ for any $0 \leq j<n \quad($ since $A[j]<x$ implies $A[j] \neq x)$

## Searching a Sorted Array

$$
\begin{aligned}
& \text { while ( } k \text { < A.length \&\& } A[k]<=x) \text { \{ } \\
& \text { if (A[k] === x) \{ } \\
& \text { return true; } \\
& \text { \} else \{ } \\
& \mathrm{k}=\mathrm{k}+1 \mathrm{n} ; \\
& \text { \} } \\
& 1 \\
& \text { \} } \\
& \{\{\mathrm{A}[\mathrm{j}]<\mathrm{x} \text { for any } 0 \leq \mathrm{j}<\mathrm{k} \text { and }(\mathrm{k}=\mathrm{n} \text { or } \mathrm{A}[\mathrm{k}]>\mathrm{x})\}\} \\
& \{\{\mathrm{A}[\mathrm{j}] \neq \mathrm{x} \text { for any } 0 \leq \mathrm{j}<\mathrm{n}\}\} \\
& \text { return false; }
\end{aligned}
$$

Case $\mathrm{x}<\mathrm{A}[\mathrm{k}]$ :
Know that $\mathrm{A}[\mathrm{j}]<\mathrm{x}$ for any $0 \leq \mathrm{j}<\mathrm{k}$ and $\mathrm{x}<\mathrm{A}[\mathrm{k}]$
Precondition (sorted) says $A[k] \leq A[k+1] \leq \ldots$
Know that $A[j]<x$ for any $0 \leq j<k$ and $x<A[j]$ for any $k \leq j<n$
This means $A[j] \neq \mathrm{x}$ for any $0 \leq \mathrm{j}<\mathrm{n}$

## Searching a Sorted Array

$$
\left.\begin{array}{l}
\text { while }(k<A . l e n g t h ~ \& \& A[k]<=x)\{ \\
\quad \text { if }(A[k]===x)\{ \\
\quad \text { return true; } \\
\quad\} \text { else }\{ \\
\quad k=k+1 n ; \\
\}
\end{array}\right\} \begin{aligned}
& \quad\} \\
& \{\{A[j]<x \text { for any } 0 \leq j<k \text { and }(k=n \text { or } A[k]>x)\}\} \\
& \{\{A[j] \neq x \text { for any } 0 \leq j<n\}\} \\
& \text { return false; }
\end{aligned}
$$

Since one of the cases $\mathrm{k}=\mathrm{n}$ and $\mathrm{x}<\mathrm{A}[\mathrm{k}]$ must hold, we have shown that

$$
A[j] \neq x \text { for any } 0 \leq j<n
$$

holds in general.

## Searching a Sorted Array

```
let k: bigint = 0n;
{{Inv: A[j] < x for any 0\leq j < k and 0\leqk\leqn }}
while (k < A.length && A[k] <= x) {
    {{A[j]< x for any 0\leq j < k and 0\leqk< n and A[k]\leqx }}
    if (A[k] === x) {
        return true;
    } else {
        k = k + 1n;
    }
    {{A[j]< x for any 0\leq j < k and 0\leqk\leqn}}
}
return false;
```

## Searching a Sorted Array

```
\(\{\{\) Inv: \(\mathrm{A}[\mathrm{j}]<\mathrm{x}\) for any \(0 \leq \mathrm{j}<\mathrm{k}\) and \(0 \leq \mathrm{k} \leq \mathrm{n}\}\}\)
while ( \(k<A . l e n g t h ~ \& \& ~ A[k]<=x) ~\{\)
    \(\{\{\mathrm{A}[\mathrm{j}]<\mathrm{x}\) for any \(0 \leq \mathrm{j}<\mathrm{k}\) and \(0 \leq \mathrm{k}<\mathrm{n}\) and \(\mathrm{A}[\mathrm{k}] \leq \mathrm{x}\}\}\)
    if (A[k] === x) \{
        \(\{\{\mathrm{A}[\mathrm{j}]<\mathrm{x}\) for any \(0 \leq \mathrm{j}<\mathrm{k}\) and \(0 \leq \mathrm{k}<\mathrm{n}\) and \(\mathrm{A}[\mathrm{k}]=\mathrm{x}\}\}\)
        \(\{\{\mathrm{A}[\mathrm{j}]=\mathrm{x}\) for some \(0 \leq \mathrm{j}<\mathrm{n}\}\}\)
        return true;
    \}
\begin{tabular}{l|l|l|}
\hline & x & \\
\hline 0 & k & n
\end{tabular}
```

Is the postcondition true?

Yes! It holds for $\mathrm{j}=\mathrm{k}$

## Searching a Sorted Array

$\{\{$ Inv: $\mathrm{A}[\mathrm{j}]<\mathrm{x}$ for any $0 \leq \mathrm{j}<\mathrm{k}$ and $0 \leq \mathrm{k} \leq \mathrm{n}\}\}$
while ( $k<A . l e n g t h$ \& $\&[k]<=x)$ \{
$\{\{\mathrm{A}[\mathrm{j}]<\mathrm{x}$ for any $0 \leq \mathrm{j}<\mathrm{k}$ and $0 \leq \mathrm{k}<\mathrm{n}$ and $\mathrm{A}[\mathrm{k}] \leq \mathrm{x}\}\}$
if (A[k] === x) \{
return true;
\} else \{
$\{\{A[j]<x$ for any $0 \leq \mathrm{j}<\mathrm{k}$ and $0 \leq \mathrm{k}<\mathrm{n}$ and $\mathrm{A}[\mathrm{k}]<\mathrm{x}\}\}$
$\mathrm{k}=\mathrm{k}+1 \mathrm{n}$;
$\{\{\mathrm{A}[\mathrm{j}]<\mathrm{x}$ for any $0 \leq \mathrm{j}<\mathrm{k}-1$ and $0 \leq \mathrm{k}-1<\mathrm{n}$ and $\mathrm{A}[\mathrm{k}-1]<\mathrm{x}\}\}$
\}
$\{\{\mathrm{A}[\mathrm{j}]<\mathrm{x}$ for any $0 \leq \mathrm{j}<\mathrm{k}-1$ and $0 \leq \mathrm{k}-1<\mathrm{n}$ and $\mathrm{A}[\mathrm{k}-1]<\mathrm{x}\}\}$
$\{\{\mathrm{A}[\mathrm{j}]<\mathrm{x}$ for any $0 \leq \mathrm{j}<\mathrm{k}$ and $0 \leq \mathrm{k} \leq \mathrm{n}\}\}$
\}
return false;

Step 1: What facts need proof?

## Searching a Sorted Array

$\{\{$ Inv: $\mathrm{A}[\mathrm{j}]<\mathrm{x}$ for any $0 \leq \mathrm{j}<\mathrm{k}$ and $0 \leq \mathrm{k} \leq \mathrm{n}\}\}$
while ( $k<A . l e n g t h ~ \& \& ~ A[k]<=x)$ \{
$\{\{\mathrm{A}[\mathrm{j}]<\mathrm{x}$ for any $0 \leq \mathrm{j}<\mathrm{k}$ and $0 \leq \mathrm{k}<\mathrm{n}$ and $\mathrm{A}[\mathrm{k}] \leq \mathrm{x}\}\}$
if (A[k] === x) \{
return true;
\} else \{
$\{\{A[j]<x$ for any $0 \leq \mathrm{j}<\mathrm{k}$ and $0 \leq \mathrm{k}<\mathrm{n}$ and $\mathrm{A}[\mathrm{k}]<\mathrm{x}\}\}$
$\mathrm{k}=\mathrm{k}+1 \mathrm{n}$;
$\{\{\mathrm{A}[\mathrm{j}]<\mathrm{x}$ for any $0 \leq \mathrm{j}<\mathrm{k}-1$ and $0 \leq \mathrm{k}-1<\mathrm{n}$ and $\mathrm{A}[\mathrm{k}-1]<\mathrm{x}\}\}$
\}
$\{\{\mathrm{A}[\mathrm{j}]<\mathrm{x}$ for any $0 \leq \mathrm{j}<\mathrm{k}-1$ and $0 \leq \mathrm{k}-1<\mathrm{n}$ and $\mathrm{A}[\mathrm{k}-1]<\mathrm{x}\}\}$
$\{\{\mathrm{A}[\mathrm{j}]<\mathrm{x}$ for any $0 \leq \mathrm{j}<\mathrm{k}$ and $0 \leq \mathrm{k} \leq \mathrm{n}\}\}$
\}
return false;

Step 1: What facts need proof?
Only $A[k-1]<x$

Step 2: prove the new fact(s)
$\mathrm{A}[\mathrm{k}-1]<\mathrm{x}$ is known

## Loops Invariants with Arrays

- Loop invariants often have lots of facts
- recursion has fewer
- Much of the work is just keeping track of them
- "dynamic programs" (421) are often like this
- common to need to write these down more likely to see line-by-line reasoning on hard problems

## Loops Invariants with Arrays

Implications btw "for any" facts are proven in two steps:

1. Figure out what facts are not already known
2. Prove just those "new" facts

Another Example:

$$
\begin{aligned}
& \{\{\mathrm{A}[\mathrm{j}]<\mathrm{x} \text { for any } 0<\mathrm{j}<\mathrm{k}\}\} \text { versus } \\
& \{\{\mathrm{A}[\mathrm{j}]<\mathrm{x} \text { for any } 0 \leq \mathrm{j}<\mathrm{k}\}\} \\
& \quad \text { - only need to prove } \mathrm{A}[0]<\mathrm{x}
\end{aligned}
$$

## Finding Loop Invariants

- Loop invariant is often a weakening of postcondition...

```
\(\{\{\) Inv: \(s=\operatorname{sum}(A[0 . . j-1]) \ldots\}\}\)
\(\{\{\) Post: \(\mathrm{s}=\operatorname{sum}(\mathrm{A}[0 \mathrm{n} \mathrm{n}-1])\}\}\)
\(\{\{\) Inv: contains \((\mathrm{A}[0 \mathrm{O} . \mathrm{j}-1], \mathrm{x})=\mathrm{F} . .\}\).
sum of array
\(\{\{\) Post: contains \((\mathrm{A}[0 . . \mathrm{n}-1], \mathrm{x})=\mathrm{F}\}\}\)
```

- but not always...
$\{\{$ Inv: $\mathrm{A}[\mathrm{j}]<\mathrm{x}$ for any $0 \leq \mathrm{j}<\mathrm{k} \ldots\}\}$
$\{\{$ Post: $\mathrm{A}[\mathrm{j}] \neq \mathrm{x}$ for any $0 \leq \mathrm{j}<\mathrm{n}\}\}$
search a sorted array

## Array Loop Expectations

## In 331, expect you to (eventually) be able to

1. Write invariant that is a simple weakening of postcondition

- problems of lower complexity

2. Write the code, given the idea \& invariant

- problems of moderate complexity

3. Check correctness, given code with invariant

- problems of higher complexity
- (not possible without invariant)

## Array Loop Expectations

## In 331, expect you to (eventually) be able to

1. Write invariant that is a simple weakening of postcondition

- problems of lower complexity
- typical examples:
$\{\{$ Inv: $s=\operatorname{sum}(A[0 . . j-1]) \ldots\}$
sum of array
$\{\{$ Post: $s=\operatorname{sum}(A[0 . . n-1])\}\}$
$\{\{$ Inv: contains $(\mathrm{A}[0 . . \mathrm{j}-1], \mathrm{x})=\mathrm{F} . .\}$.
search an array
$\{\{$ Post: contains(A[0 .. $\mathrm{n}-1], \mathrm{x})=\mathrm{F}\}\}$

## Array Loop Expectations

## In 331, expect you to (eventually) be able to

1. Write invariant that is a simple weakening of postcondition

- problems of lower complexity

2. Write the code, given the idea \& invariant

- problems of moderate complexity

3. Check correctness, given code with invariant

- problems of higher complexity
- (not possible without invariant)

## Searching a Sorted Array (Take Two)

- What is a faster way to search a sorted array?
- use binary search!
- invariant looks like this:

## Searching a Sorted Array (Take Two)

- Would not expect you to invent binary search
- but would expect you can code review an implementation all code and the invariant are provided

## Array Loop Expectations

In 331, expect you to (eventually) be able to

1. Write invariant that is a simple weakening of postcondition

- problems of lower complexity

2. Write the code, given the idea \& invariant

- problems of moderate complexity

3. Check correctness, given code with invariant

- problems of higher complexity
- (not possible without invariant)

## From Invariant to Code (Problem Type 2)

- Algorithm Idea formalized in
- invariant
- progress step (e.g., $\mathrm{j}=\mathrm{j}+1$ )

From invariant to code:

1. Write code before loop to make Inv hold initially
2. Write code inside loop to make Inv hold again
3. Choose exit so that "Inv and not cond" implies postcondition

## Max of an Array (Problem Type 2)

- Calculate a number " m " that is the max in array A
- Algorithm Idea...
- look through the loop from $\mathrm{k}=0$ up to $\mathrm{n}-1$
- keep track of the maximum of $\mathrm{A}[0$.. k-1] in "m"
- formalize that in an invariant...

## Max of an Array (Problem Type 2)

- Calculate a number " m " that is the max in array A
- Algorithm Idea...
- look through the loop from $k=0$ up to $n-1$
- keep track of the maximum of $A[0$.. k-1] in "m"
- $m$ is the maximum of $A[0$.. $k-1]$, i.e.,

$$
\begin{array}{ll}
A[j] \leq m \text { for any } 0 \leq j<k & m \text { is at least } A[0], . ., A[k-1] \\
A[i]=m \text { and } 0 \leq i<k & m \text { is some } A[i] \text { in this range }
\end{array}
$$

- Invariant references "m", "k", and "i"
- these will be variables in the code

## Max of an Array (Problem Type 2)

```
{{ Pre: n := A.length > 0 }}
let k: bigint =
let i: bigint = ...
let m: bigint =
```

$\{\{$ Inv: $(\mathrm{A}[\mathrm{j}] \leq \mathrm{m}$ for any $0 \leq \mathrm{j}<\mathrm{k})$ and $\mathrm{A}[\mathrm{i}]=\mathrm{m}$ and $0 \leq \mathrm{i}<\mathrm{k} \leq \mathrm{n}\}\}$
while
$\qquad$
) \{
$\mathrm{k}=\mathrm{k}+1 \mathrm{n} ;$
\}
$\{\{$ Post: $(\mathrm{A}[\mathrm{j}] \leq \mathrm{m}$ for any $0 \leq \mathrm{j}<\mathrm{n})$ and $\mathrm{A}[\mathrm{i}]=\mathrm{m}$ and $0 \leq \mathrm{j}<\mathrm{n}\}\}$
return m;

## Max of an Array (Problem Type 2)

```
{{ Pre: n := A.length > 0 }}
let k: bigint = 1n;
let i: bigint = 0n;
let m: bigint = A[O];
{{ Inv: (A[j] \leqm for any 0\leq j < k) and A[i] = m and 0\leqi<k\leqn }}
while
```

$\qquad$

```
) {
What extra fact would make this match Post?
    k = k + 1n;
    k=n
```

$\{\{$ Post: $(\mathrm{A}[\mathrm{j}] \leq \mathrm{m}$ for any $0 \leq \mathrm{j}<\mathrm{n})$ and $\mathrm{A}[\mathrm{i}]=\mathrm{m}$ and $0 \leq \mathrm{i}<\mathrm{n}\}\}$
return m;

## Max of an Array (Problem Type 2)

```
{{ Pre: n := A.length > 0 }}
let k: bigint = 1n;
let i: bigint = 0n;
let m: bigint = A[O];
{{ Inv: (A[j] \leqm for any 0\leq j < k) and A[i] = m and 0 \leqi<k\leqn }}
while (k < n) {
    k = k + 1n;
}
```

$\{\{$ Post: $(\mathrm{A}[\mathrm{j}] \leq \mathrm{m}$ for any $0 \leq \mathrm{j}<\mathrm{n})$ and $\mathrm{A}[\mathrm{j}]=\mathrm{m}$ and $0 \leq \mathrm{i}<\mathrm{n}\}\}$
return m;

## Max of an Array (Problem Type 2)

```
{{ Pre: n := A.length > 0 }}
let k: bigint = 1n;
let i: bigint = 0n;
let m: bigint = A[i];
```

$\{\{$ Inv: $(\mathrm{A}[\mathrm{j}] \leq \mathrm{m}$ for any $0 \leq \mathrm{j}<\mathrm{k})$ and $\mathrm{A}[\mathrm{i}]=\mathrm{m}$ and $0 \leq \mathrm{i}<\mathrm{k} \leq \mathrm{n}\}\}$
while (k < n) \{
$\{\{(\mathrm{A}[\mathrm{j}] \leq \mathrm{m}$ for any $0 \leq \mathrm{j}<\mathrm{k})$ and $\mathrm{A}[\mathrm{i}]=\mathrm{m}$ and $0 \leq \mathrm{i}<\mathrm{k}<\mathrm{n}\}\}$
$\mathrm{k}=\mathrm{k}+1 \mathrm{n}$;
$\{\{(\mathrm{A}[\mathrm{j}] \leq \mathrm{m}$ for any $0 \leq \mathrm{j}<\mathrm{k})$ and $\mathrm{A}[\mathrm{i}]=\mathrm{m}$ and $0 \leq \mathrm{i}<\mathrm{k} \leq \mathrm{n}\}\}$
\}
$\{\{$ Post: $(\mathrm{A}[\mathrm{j}] \leq \mathrm{m}$ for any $0 \leq \mathrm{j}<\mathrm{n})$ and $\mathrm{A}[\mathrm{i}]=\mathrm{m}$ for some $0 \leq \mathrm{i}<\mathrm{n}\}\}$ return m;

## Max of an Array (Problem Type 2)

```
{{ Pre: n := A.length > 0 }}
let k: bigint = 1n;
let i: bigint = 0n;
let m: bigint = A[0];
{{ Inv: A[j] \leqm for any 0\leqj<k and A[j] = m for some 0 \leq j < k and 0\leqk\leqn }}
while (k < n) {
    {{(A[j]\leqm for any 0\leq j < k) and A[i]=m}\mathrm{ and 0 
    {{(A[j] \leqm for any 0\leqj<k+1) and A[i] = m and 0\leqi<k+1\leqn}} ]
    k = k + 1n;
    {{(A[j] \leqm for any 0\leqj<k) and A[i] = m and 0\leqi<k\leqn}}
}
```

$\{\{$ Post: $\mathrm{A}[\mathrm{j}] \leq \mathrm{m}$ for any $0 \leq \mathrm{j}<\mathrm{n}$ and $\mathrm{A}[\mathrm{j}]=\mathrm{m}$ for some $0 \leq \mathrm{j}<\mathrm{n}\}\}$
return m;

## Max of an Array (Problem Type 2)

$$
\left.\begin{array}{l}
\{\{(\mathrm{A}[\mathrm{j}] \leq \mathrm{m} \text { for any } 0 \leq \mathrm{j}<\mathrm{k}) \text { and } \mathrm{A}[\mathrm{i}]=\mathrm{m} \text { and } 0 \leq \mathrm{i}<\mathrm{k}<\mathrm{n}\}\} \\
\quad \ldots \\
\{\{(\mathrm{A}[\mathrm{j}] \leq \mathrm{m} \text { for any } 0 \leq \mathrm{j}<\mathrm{k}+1) \text { and } \mathrm{A}[\mathrm{i}]=\mathrm{m} \text { and } 0 \leq \mathrm{i}<\mathrm{k}+1 \leq \mathrm{n}\}\}
\end{array}\right] .
$$

Tricky because max(..) involves two sets of facts (the "for any" and the " $\mathrm{A}[\mathrm{i}]=\mathrm{m}$ ")

## Max of an Array (Problem Type 2)

```
\(\{\{(\mathrm{A}[\mathrm{j}] \leq \mathrm{m}\) for any \(0 \leq \mathrm{j}<\mathrm{k})\) and \(\mathrm{A}[\mathrm{i}]=\mathrm{m}\) and \(0 \leq \mathrm{i}<\mathrm{k}<\mathrm{n}\}\}\)
\(\{\{(\mathrm{A}[\mathrm{j}] \leq \mathrm{m}\) for any \(0 \leq \mathrm{j}<\mathrm{k}+1)\) and \(\mathrm{A}[\mathrm{i}]=\mathrm{m}\) and \(0 \leq \mathrm{i}<\mathrm{k}+1 \leq \mathrm{n}\}\}\)
\(\square\)
```

Step 1: What facts are new in the bottom assertion?

$$
\text { Just } A[k] \leq m
$$

What code do we write to ensure $A[k] \leq m$ ?

## Max of an Array (Problem Type 2)

```
while (k < n) {
    {{(A[j] \leqm for any 0 \leq j < k) and A[i] = m and 0\leqi}<\textrm{k}<\textrm{n}}
    if (A[k] <= m) {
        // we're good!
    } else
        // uh oh! what now ??
    }
    {{((A[j] \leqm for any 0\leqj<k+1) and A[i] = m and 0\leqi<k+1\leqn }}
    k = k + 1n;
}
```

Step 2: What do we do if $A[k]>m$ does not hold?
We must change $m$ so that $A[k] \leq m$ holds again
But we also need to $\mathrm{A}[\mathrm{i}]=\mathrm{m}$ (and $0 \leq \mathrm{i}<\mathrm{k}+1$ ) to still hold
How do we do that?

## Max of an Array (Problem Type 2)

```
{{ Pre: n := A.length > 0 }}
let k: bigint = 1n;
let i: bigint = 0n;
let m: bigint = A[O];
```

$\{\{$ Inv: $(\mathrm{A}[\mathrm{j}] \leq \mathrm{m}$ for any $0 \leq \mathrm{j}<\mathrm{k})$ and $\mathrm{A}[\mathrm{i}]=\mathrm{m}$ and $0 \leq \mathrm{i}<\mathrm{k} \leq \mathrm{n}\}\}$
while ( $k<n$ ) \{
if (A[k] > m) \{
i $=k$;
m = A[i];
\}
$\mathrm{k}=\mathrm{k}+1 \mathrm{n} ;$
\}
$\left\{\left\{\right.\right.$ Post: $\left(\mathrm{A}[\mathrm{j}] \leq \mathrm{m}\right.$ for any $0 \leq \mathrm{j}<\mathrm{n}_{-}$and $\mathrm{A}[\mathrm{i}]=\mathrm{m}$ and $\left.\left.0 \leq \mathrm{i}<\mathrm{n}\right\}\right\}$

## Servers \& Routes

## Client-Side JavaScript

- Code so far has run inside the browser
- webpack-dev-server handles HTTP requests
- sends back our code to the browser
- Browser executes the code of index.tsx
- calls root.render to produce the UI

webpack-dev-server

## Server-Side JavaScript

- Can run code in the server as well
- allows us to store data on the server instead
- "node" executes the code of index.ts
- Start writing server-side code in HW7
- will have code in both browser and server in HW8-9

## HTTP Terminology

- HTTP request includes
- method: GET or POST (for us)

GET is used to read data stored on the server
(cacheable)
POST is used to change data stored on the server

- URL: path and query parameters
can include query parameters
- body (for POST only)
useful for sending large or non-string data with the request
- Browser issues a GET request when you type URL
$\leftarrow \rightarrow \mathrm{C}$

## HTTP Terminology

- HTTP response includes
- status code: 200 (ok), 400-99 (client error), or 500-99 (server error)
was the server able to respond
- content type: text/HTML or application/JSON (for us)
what sort of data did the server send back
- content
in format described by the Content Type
- Browser expects HTML to display in the page
- we will send JSON data back to our code in the browser

## Custom Server

- Create a custom server as follows:

```
const F = (req: SafeRequest, res: SafeResponse): void => {
}
const app = express();
app.get("/foo", F);
app.listen(8080);
```

- request for http://localhost:8080/foo will call F
- mapping from "/ foo" to F is called a "route"
- can have as many routes as we want (with different URLs)

## Custom Server

- Query parameters (e.g., ? name=Fred) in SafeRequest

```
const F = (req: SafeRequest, res: SafeResponse) : void => {
    const name: string|undefined = req.query.name;
    if (name === undefined) {
        res.status(400).send("Missing 'name'");
        return;
                                    type is more complicated...
                                    parameters can be repeated
    }
    ... / / name was provided
}
```

- set status to 400 to indicate a client error (Bad Request)
- set status to 500 to indicate a server error
- default status is 200 (OK)

## Custom Server

- Query parameters (e.g., ? name=Fred) in SafeRequest

```
const F = (req: SafeRequest, res: SafeResponse): void => {
    const name: string|undefined = first(req.query.name);
    if (name === undefined) {
        res.status(400) .send("Missing 'name'");
        return;
    }
    ... // name was provided
}
```

- set status to 400 to indicate a client error (Bad Request)
- set status to 500 to indicate a server error
- default status is 200 (OK)

## Custom Server

- Query parameters (e.g., ?name=Fred) in SafeRequest

```
const F = (req: SafeRequest, res: SafeResponse): void => {
    const name: string|undefined = req.query.name;
    if (name === undefined) {
        res.status(400) .send("Missing 'name'");
        return;
    }
    res.send({message: `Hi, ${name}`});
}
```

- send of string returned as text/HTML
- send of record returned as application/JSON

## Example App from Section 7

Animal Trivia

Submit

User types "blue" and presses "Submit"...

Sorry, your answer was incorrect.

New Question

## Server-Side JavaScript

- Apps will make sequence of requests to server

## "Network" Tab Shows Requests

| Name | Status |
| :--- | :--- |
| 目 localhost | 200 |
| $\square$ qna.js | 200 |
| $\square$ new | 200 |
| $\square$ favicon.ico | 200 |
| $\square$ check?index=O\&answer=blue | 304 |

- Shows every request to the server
- first request loads the app (as usual)
- "new" is a request to get a question
- "check?index=0\&answer=blue" is a request to check answer
- Click on a request to see details...

## "Network" Tab Shows Request \& Response

| Name | $\times$ | Headers | Preview | Response | Initiator | Timing |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 目 localhost | $\checkmark$ General |  |  |  |  |  |
| - qna.js | Request URL: http://localhost:8080/new |  |  |  |  |  |
| $\square$ new |  |  |  |  |  |  |
| $\square$ favicon.ico | Request Method: GET |  |  |  |  |  |
| $\square$ check? index=0\&answer=blue | Status Code: ${ }^{\text {e }} 200$ OK |  |  |  |  |  |
| 5 requests 8.9 kB transferred | Referrer Policy: strict-origin-when-cross-origin |  |  |  |  |  |

| Name | $\times$ | Headers | Preview | Response | Initiator | Timing |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 目 localhost |  | 1 \{"index":0,"text":"What is your favorite color?"\} |  |  |  |  |
| ( qna.js |  |  |  |  |  |  |
| $\square$ new |  |  |  |  |  |  |
| $\square$ favicon.ico |  |  |  |  |  |  |
| $\square$ check?index=0\&answer=blue |  |  |  |  |  |  |
| 5 requests 8.9 kB transferred | \{\} |  |  |  |  |  |

## JSON

- JavaScript Object Notation
- text description of JavaScript object
- allows strings, numbers, null, arrays, and records
no undefined and no instances of classes no '..' (single quotes), only ".."
requires quotes around keys in records
- another tree!
- Translation into string done automatically by send

```
res.send({index: 0, text: 'What is your ...?'});
```

| Name | $\times \quad$ Headers Preview $\quad$ Response Initiator Timing |  |
| :--- | :--- | :--- |
| 目 localhost | 1 \|\{"index":0,"text":"What is your favorite color?"\} |  |
| qna.js |  |  |
| $\square$ new |  |  |

## Testing Server-Side TypeScript

- A route calls an ordinary function
- Testing is the same as on the client side
- write unit tests in X _test. ts files
- run then using npm run test
- Libraries help set up Request \& Response for tests
- can check the status returned was correct
e.g., 200 or 400
- can check the response body was correct
e.g., "Missing 'name'" or \{message: "Hi, Fred"\}

## Testing Server-Side TypeScript

- A route calls an ordinary function
- Client- and server-side code is made up of functions
- server functions handles requests for specific URLs
- client functions draw data, create requests, etc.
- test (and code review) each one
- Key Point: unit test each function thoroughly
- often hard to figure which part caused the failure
failure in the client could be due to a bug in the server
- debugging that will be painful
- need a higher standard of correctness in a larger app
much easier to debug failing tests than errors in the app

## Functions with Mutations

## Specifying Functions that Mutate

- Our functions so far have not mutated anything makes things much simpler!
- Cannot yet write a spec for sorting an array
- could return a sorted version of the array
- but cannot say that we change the array to be sorted
- Need some new tags to describe that...

## Specifying Functions that Mutate

- By default, no parameters are mutated
- must explicitly say that mutation is possible (default not)

```
/**
    * Reorders A so the numbers are in increasing order
    * @param A array of integers to be sorted
    * @modifies A
    * @effects A contains the same numbers but now in
    * increasing order
    * /
const quickSort = (A: bigint[]): void => { .. };
```

- anything that might be changed is listed in @modifies
not a promise to modify it - A could already be sorted!
a shorter modifies list is a stronger specification

## Specifying Functions that Mutate

- By default, no parameters are mutated
- must explicitly say that mutation is possible (default not)

```
/**
    * Reorders A so the numbers are in increasing order
    * @param A array of integers to be sorted
    * @modifies A
    * @effects A contains the same numbers but now in
    * increasing order
    * /
const quickSort = (A: bigint[]): void => { .. };
```

- @effects gives promises about result after mutation like @returns but for mutated values, not return value this returns void, so no @returns

## Mutating Arrays

- Assigning to array elements changes known state

$$
\left\lvert\, \begin{aligned}
& \{\{\mathrm{A}[\mathrm{j}-1]<\mathrm{A}[\mathrm{j}] \text { for any } 1 \leq \mathrm{j} \leq 5\}\} \\
& \mathrm{A}[0]=100 ; \\
& \{\{\mathrm{A}[\mathrm{j}-1]<\mathrm{A}[\mathrm{j}] \text { for any } 2 \leq \mathrm{j} \leq 5 \text { and } \mathrm{A}[0]=100\}\}
\end{aligned}\right.
$$

- Can add to the end of an array

$$
\downarrow \begin{aligned}
& \text { A.push }(100) ; \\
& \left\{\left\{A=A_{0}+[100]\right\}\right\}
\end{aligned}
$$

- Can remove from the end of an array

$$
\downarrow \begin{aligned}
& \text { A.pop }() ; \\
& \left\{\left\{A=A_{0}[0 . . n-2]\right\}\right\}
\end{aligned}
$$

## Example Mutating Function

- Reorder an array so that
- negative numbers come first, then zeros, then positives
(not necessarily fully sorted)

```
/**
    * Reorders A into negatives, then Os, then positive
    * @modifies A
    * @effects leaves same integers in A but with
    * A[j] < 0 for 0 <= j < i
    * A[j] = 0 for i <= j < k
    * A[j] > 0 for k <= j < n
    * @returns the indexes (i, k) above
    */
const sortPosNeg = (A: bigint[]): [bigint,bigint] =>
```

## Example: Sorting Negative, Zero, Positive

```
// @effects leaves same numbers in A but with
// A[j] < 0 for 0 <= j < i
// A[j] = 0 for i <= j < k
// A[j] > 0 for k <= j < n
```

|  | $<0$ |  | $=0$ |  |
| :--- | :--- | :--- | :--- | :--- |

Let's implement this...

- what was our heuristic for guessing an invariant?
- weaken the postcondition

## Example: Sorting Negative, Zero, Positive

## How should we weaken this for the invariant?

- needs allow elements with unknown values
initially, we don't know anything about the array values

## Example: Sorting Negative, Zero, Positive

## Our Invariant:

| $<0$ | $=0$ | $?$ | $>0$ |
| :--- | :--- | :--- | :--- |
| 0 | i | $j$ | k |

$\mathrm{A}[\ell]<0$ for any $0 \leq \ell<\mathrm{i}$
$\mathrm{A}[\ell]=0$ for any $\mathrm{i} \leq \ell<\mathrm{j}$
(no constraints on $\mathrm{A}[\ell]$ for $\mathrm{j} \leq \ell<\mathrm{k}$ )
$\mathrm{A}[\ell]>0$ for any $\mathrm{k} \leq \ell<\mathrm{n}$

## Example: Sorting Negative, Zero, Positive

- Let's try figuring out the code (problem type 2)
- on homework, this would be type 3 (check correctness)
- Figure out the code for
- how to initialize
- when to exit
- loop body

## Example: Sorting Negative, Zero, Positive

- Will have variables $\mathrm{i}, \mathrm{j}$, and k with $\mathrm{i} \leq \mathrm{j}<\mathrm{k}$
- How do we set these to make it true initially?
- we start out not knowing anything about the array values
- set $\mathrm{i}=\mathrm{j}=0$ and $\mathrm{k}=\mathrm{n}$

## Example: Sorting Negative, Zero, Positive

| $<0$ | $=0$ | $?$ | $>0$ |
| :--- | :--- | :--- | :--- |
| 0 | i | $j$ | $k$ |

- Set $\mathrm{i}=\mathrm{j}=0$ and $\mathrm{k}=\mathrm{n}$ to make this hold initially
- When do we exit?
- purple is empty if $\mathrm{j}=\mathrm{k}$

## Sort Positive, Zero, Negative

```
let i: bigint = 0n;
let j: bigint = 0;
let k: bigint = A.length;
{{ Inv: A[\ell]<0 for any 0\leq\ell< i and A[\ell]=0 for any i }\leq\ell<\textrm{j
    A[\ell]>0 for any k \leq\ell< n and 0\leqi }\leq\textrm{j}\leq\textrm{k}\leq\textrm{n}}
while (j < k) {
}
{{A[\ell]<0 for any 0\leq\ell< i and A[\ell]=0 for any i }\leq\ell<\textrm{j
    A[\ell]>0 for any j \leq\ell< n }}
return [i, j];
```

## Example: Sorting Negative, Zero, Positive

- How do we make progress?
- try to increase j by 1 or decrease $k$ by 1
- Look at $\mathrm{A}[\mathrm{j}]$ and figure out where it goes
- What to do depends on $\mathrm{A}[\mathrm{j}]$
- could be $<0,=0$, or $>0$

## Example: Sorting Negative, Zero, Positive

Set $\mathrm{j}=\mathrm{j}_{0}+1$

Swap $A[i]$ and $A[j]$
Set $\mathrm{i}=\mathrm{i}_{0}+1$
and $\mathrm{j}=\mathrm{j}_{0}+1$

Swap $A[j]$ and $A[k-1]$ Set $k=k_{0}-1$

## Sort Positive, Zero, Negative

```
\(\{\{\) Inv: \(\mathrm{A}[\ell]<0\) for any \(0 \leq \ell<\mathrm{i}\) and \(\mathrm{A}[\ell]=0\) for any \(\mathrm{i} \leq \ell<\mathrm{j}\)
    \(\mathrm{A}[\ell]>0\) for any \(\mathrm{k} \leq \ell<\mathrm{n}\) and \(0 \leq \mathrm{i} \leq \mathrm{j} \leq \mathrm{k} \leq \mathrm{n}\}\}\)
while (j ! == k) \{
    if (A[j] === 0n) \{
        \(j=j+1 n ;\)
    \} else if (A[j] < On) \{
        swap(A, i, j);
        \(i=i+1 n\);
        \(j=j+1 n ;\)
    \} else \{
        swap (A, j, k);
        \(\mathrm{k}=\mathrm{k}-1 \mathrm{n} ;\)
    \}
\}
```

Combine forward and backward reasoning to double check correctness.

## Sort Positive, Zero, Negative

```
\(\{\{\) Inv: \(\mathrm{A}[\ell]<0\) for any \(0 \leq \ell<\mathrm{i}\) and \(\mathrm{A}[\ell]=0\) for any \(\mathrm{i} \leq \ell<\mathrm{j}\)
    \(\mathrm{A}[\ell]>0\) for any \(\mathrm{k} \leq \ell<\mathrm{n}\}\}\)
while (j ! == k) \{
    \} else if (A[j] < On) \{
    \(\{\{\mathrm{A}[\ell]<0\) for any \(0 \leq \ell<\mathrm{i}\) and \(\mathrm{A}[\ell]=0\) for any \(\mathrm{i} \leq \ell<\mathrm{j}\)
        \(\mathrm{A}[\ell]>0\) for any \(\mathrm{k} \leq \ell<\mathrm{n}\) and \(0 \leq \mathrm{i} \leq \mathrm{j} \leq \mathrm{k} \leq \mathrm{n}\) and \(\mathrm{A}[\mathrm{j}]<0\}\}\)
        swap(A, i, j);
        \(i=i+1 n\);
        \(j=j+1 n ;\)
        \(\{\{\mathrm{A}[\ell]<0\) for any \(0 \leq \ell<\mathrm{i}\) and \(\mathrm{A}[\ell]=0\) for any \(\mathrm{i} \leq \ell<\mathrm{j}\)
        \(\mathrm{A}[\ell]>0\) for any \(\mathrm{k} \leq \ell<\mathrm{n}\) and \(0 \leq \mathrm{i} \leq \mathrm{j} \leq \mathrm{k} \leq \mathrm{n}\}\}\)
    \}
```

## Sort Positive, Zero, Negative

```
\(\{\{\) Inv: \(\mathrm{A}[\ell]<0\) for any \(0 \leq \ell<\mathrm{i}\) and \(\mathrm{A}[\ell]=0\) for any \(\mathrm{i} \leq \ell<\mathrm{j}\)
    \(\mathrm{A}[\ell]>0\) for any \(\mathrm{k} \leq \ell<\mathrm{n}\}\}\)
while (j ! == k) \{
    \} else if ( \(\mathrm{A}[\mathrm{j}]<0 \mathrm{n}\) ) \{
    \(\{\{\mathrm{A}[\ell]<0\) for any \(0 \leq \ell<\mathrm{i}\) and \(\mathrm{A}[\ell]=0\) for any \(\mathrm{i} \leq \ell<\mathrm{j}\)
        \(\mathrm{A}[\ell]>0\) for any \(\mathrm{k} \leq \ell<\mathrm{n}\) and \(\mathrm{A}[\mathrm{j}]<0\}\}\)
        \(\operatorname{swap}(A, i, j) ;\)
        \(\{\{\mathrm{A}[\ell]<0\) for any \(0 \leq \ell<\mathrm{i}+1\) and \(\mathrm{A}[\ell]=0\) for any \(\mathrm{i}+1 \leq \ell<\mathrm{j}+1\)
        \(A[\ell]>0\) for any \(\mathrm{k} \leq \ell<\mathrm{n}\) and \(0 \leq \mathrm{i}+1 \leq \mathrm{j}+1 \leq \mathrm{k} \leq \mathrm{n}\}\}\)
    i \(=1+1 n\);
    \(j=j+1 n ;\)
    \(\{\{\mathrm{A}[\ell]<0\) for any \(0 \leq \ell<\mathrm{i}\) and \(\mathrm{A}[\ell]=0\) for any \(\mathrm{i} \leq \ell<\mathrm{j}\)
        \(\mathrm{A}[\ell]>0\) for any \(\mathrm{k} \leq \ell<\mathrm{n}\) and \(0 \leq \mathrm{i} \leq \mathrm{j} \leq \mathrm{k} \leq \mathrm{n}\}\}\)
    \}
```

## Sort Positive, Zero, Negative

$$
\begin{aligned}
& \{\{\mathrm{A}[\ell]<0 \text { for any } 0 \leq \ell<\mathrm{i} \text { and } \mathrm{A}[\ell]=0 \text { for any } \mathrm{i} \leq \ell<\mathrm{j} \\
& \quad \mathrm{A}[\ell]>0 \text { for any } \mathrm{k} \leq \ell<\mathrm{n} \text { and } 0 \leq \mathrm{i} \leq \mathrm{j} \leq \mathrm{k} \leq \mathrm{n} \text { and } \mathrm{A}[\mathrm{j}]<0\}\} \\
& \text { swap }(\mathrm{A}, \mathrm{i}, \mathrm{j}) \text {; } \\
& \{\{\mathrm{A}[\ell]<0 \text { for any } 0 \leq \ell<\mathrm{i}+1 \text { and } \mathrm{A}[\ell]=0 \text { for any } \mathrm{i}+1 \leq \ell<\mathrm{j}+1 \\
& \quad \mathrm{A}[\ell]>0 \text { for any } \mathrm{k} \leq \ell<\mathrm{n} \text { and } 0 \leq \mathrm{i}+1 \leq \mathrm{j}+1 \leq \mathrm{k} \leq \mathrm{n}\}\}
\end{aligned}
$$

Easiest to stop here since this is a function call. (Need to use its spec.)

Step 1: What facts are new in the bottom assertion?

New facts are $A[i]<0$ and $A[j]=0$
Initially have $\mathrm{A}[\mathrm{i}]=0$ and $\mathrm{A}[\mathrm{j}]<0$
Swapping them gives what we want.

Other 2 cases are similar... (Exercise)
