```

Administrivia

- HW 3 released later today, due wednesday (4/23) at 11pm

Client-Side vs Server-Side – Review

- **Client-Side JavaScript**

- Code so far has run inside the browser
 - webpack-dev-server handles HTTP requests
 - Sends back our code to the browser
- In the browser, executes code of index.tsx

- **Server-Side JavaScript**

- Can run code in the server as well
 - Returns different data for each request (HTML, JSON, etc.)
- Can have code in *both* browser and server

Client-Side vs Server-Side – Review

Client-Side

HTTP GET

index.html
index.tsx etc.

webpack-dev-server

Code only on
browser

VS

Server-Side

HTTP GET

response data

our server

Code on browser
and server

Custom Server

- In a custom server, we can define useful routes
- Interacting with app will result in a series of requests and responses

Aliases

(a) Class that maintains an array in a specific order

```
class MyClass {  
    // RI: vals is sorted  
    vals: Array<string>;  
    ...  
    values: (): Array<string> => {  
        return this.vals; // unsafe!  
        return this.vals.slice(0); // make a copy  
    };  
    ...  
}
```

- Do not hand out access to your own array

Aliases

(b) Make a copy of anything you want to keep

```
class MyClass {  
  // RI: vals is sorted  
  vals: Array<string>;  
  ...  
  // @requires A is sorted  
  constructor(A: Array<string>) {  
    this.vals = A; // unsafe!  
    this.vals = A.slice(0); // make a copy  
  };  
  ...  
}
```

- Do not make your own fields be something someone else has access to.

Aliases

- Objects in “Heap State” means that its still being used after the call stack finishes.
- Extra references to these objects are called “aliases”
- When having aliases to mutable heap state:
 - We can gain efficiency in some cases.
 - We must keep track of all aliases that can mutate that state.
- For 331, mutable aliasing across files is a BUG!
 - Allows other portions of your code to break you code
 - “Copy in, copy out” to avoid aliases

Steps to Writing Full Stack App (Review)

- **Data stored only in the client is *ephemeral***
 - closing the window means you lose it forever
- **Write apps in this order:**
 1. Write the client UI with local data
 - no client/server interaction at the start
 2. Write the server
 - official store of the data
 3. Connect the client to the server
 - use fetch to update data on the server before doing same to client

Fetch Request methods

1. Method that makes the fetch
2. Handler for fetch Response
3. Handler for fetched JSON
4. Handler for errors

Making an HTTP Request (Review)

- **Send & receive data from the server with “fetch”**

```
const url = "/api/list?" +  
  "category=" + encodeURIComponent(category);  
fetch(url)  
  .then(this.doListResp)  
  .catch(() => this.doListError("failed to  
connect"))
```

- **Fetch** returns a “promise” object, has `.then` & `.catch` methods
 - then handler is called if the request **can** be made
 - catch handler is called if **could not connect** to the server at all or if “then” handler **throws exception**

Handling HTTP Response (Review)

- With our conventions, **status code indicates data type**:
 - with **200 status code**, use `res.json()` to get record

```
if (res.status === 200) {
    res.json().then(this.doListJson)
    .catch(() => this.doListError("200
    response is not JSON"));}
```
 - with **400 status code**, use `res.text()` to get error message
- These methods return a **promise** of response data
 - use `.then(..)` to add a handler called with the data
 - handler `.catch(..)` called if it fails to parse

React Lifecycle Methods (Review)

- **React includes events about its “life cycle”**
 - `componentDidMount`: UI is now on the screen
 - `componentDidUpdate`: UI was just changed to match render (also called when props changes)
 - `componentWillUnmount`: UI is about to go away
- **Use “mount” to get initial data from the server**
 - constructor shouldn’t do that sort of thing

```
componentDidMount = (): void => {  
  fetch("/api/list")  
    .then(this.doListResp)  
    .catch(() => this.doListError("connect failed"));  
};
```

Let's take a look at the starter code!

Take a look at the following methods in BookReviewApp.tsx:

```
doRefreshTimeout = (): void => { . . . };  
doListResp = (res: Response): void => { . . . };  
doListJson = (val: unknown): void => { . . . };  
doListError = (msg: string): void => { . . . };
```

What is the api endpoint of doRefreshTimeout?

What method will be called if the response return a status 500 code?

- a) doListJson
- b) doListError with the message "bad status code 500"
- c) doListError with the message "500 response is not valid JSON"
- d) The .catch() block from fetch, because 500 is a server error

What is the purpose of the `this.setState({ books: books, message: "" });`?

- a) To reset the component state before making a new fetch request
- b) To update the UI with the new list of books from `val`
- c) To display an error message after an unsuccessful fetch
- d) To convert the **books** object into a JSON string for debugging

Let's take a look at the starter code!

Take a look at the following methods in BookReviewApp.tsx:

```
doRefreshTimeout = (): void => { . . . };  
doListResp = (res: Response): void => { . . . };  
doListJson = (val: unknown): void => { . . . };  
doListError = (msg: string): void => { . . . };
```

What is the api endpoint of doRefreshTimeout?

_____ /api/lists _____

What method will be called if we the response return a status 500 code?

- a) doListJson
- b) doListError with the message "bad status code 500"
- c) doListError with the message "500 response is not valid JSON"
- d) The .catch() block from fetch, because 500 is a server error

What is the purpose of the `this.setState({ books: books, message: "" });`?

- d) To convert the **books** object into a JSON string for debugging

Start the app for Task 1.
What status code do we get initially?

In Task 1, you will get a 404 status code in the console.
Which methods and file(s) should you look at?

- a) client/BookReviewApp.tsx
- b) client/index.tsx
- c) server/index.ts
- d) server/routes.ts
- e) doAddClick
- f) doAddResp
- g) doAddJSon
- h) doAddError
- i) Every single method across all files

In Task 1, you will get a 404 status code in the console.
Which methods and file(s) should you look at?

- a) client/BookReviewApp.tsx
- b) client/index.tsx
- c) server/index.ts
- d) server/routes.ts
- e) doAddClick
- f) doAddResp
- g) doAddJSon
- h) doAddError
- i) Every single method across all files

Debugging Log

- <https://comfy.cs.washington.edu/service/hw3-practice>
- Be sure to keep track of each function you work on as you debug (ex. client/server, file name, function name)
- **Example:**

Debugging Scope

Was the line of code that generated the failure in a *different function* than the line of code with the bug?

List, one per line, the functions you had to debug through to find the bug. For each one, give the file and function names.

```
client/src/Editor.tsx doSaveClick  
server/src/dijkstra.ts shortestPath
```

HW 3 Prep: Dijkstra's Algorithm

- **Main idea:** Start at the source node and find the shortest path to all reachable nodes.
 - At every step, take the shortest next step available
 - Each node we are looking at in each step should have the shortest path from the start to itself
- **Input:** graph with no negative edge weights, start node s

Node	Finished	Cost	Prev
A	False	0	-
B	False	∞	
C	False	∞	

HW 3 Prep: Dijkstra's Algorithm

Node	Finished	Cost	Prev
A	True	0	-
B	False	∞ 2	A
C	False	∞ 10	A

Node	Finished	Cost	Prev
A	True	0	-
B	True	2	A
C	True	3	A B

Dijkstra's algorithm – pseudocode

active = priority queue of paths.

finished = empty set of nodes.

add a path from start to itself to active

<inv: All paths found so far are shortest paths>

while active is non-empty:

minPath = **active.removeMin()**

 minDest = destination node in minPath

 if minDest is dest:

 return minPath

 if minDest is in finished:

 continue

 for each edge $e = \langle \text{minDest}, \text{child} \rangle$:

 if child is not in finished:

 newPath = minPath + e

 add newPath to active

 add minDest to finished

Lets Run Another Example

Node	Finished	Cost	Prev
A	False	INF	
B	False	INF	
C	False	INF	
D	False	INF	
E	False	INF	
F	False	INF	
G	False	INF	

Lets Run Another Example

Node	Finished	Cost	Prev
A	False	0	
B	False	INF	
C	False	INF	
D	False	INF	
E	False	INF	
F	False	INF	
G	False	INF	

Lets Run Another Example

Node	Finished	Cost	Prev
A	False	0	
B	False	4	A
C	False	INF	
D	False	INF	
E	False	INF	
F	False	INF	
G	False	INF	

Lets Run Another Example

Node	Finished	Cost	Prev
A	True	0	
B	False	3	A
C	False	4	A
D	False	INF	
E	False	INF	
F	False	INF	
G	False	INF	

Lets Run Another Example

Node	Finished	Cost	Prev
A	True	0	
B	False	3	A
C	False	4	A
D	False	$3 + 4 = 7$	B
E	False	INF	
F	False	INF	
G	False	INF	

Lets Run Another Example

Node	Finished	Cost	Prev
A	True	0	
B	True	3	A
C	False	4	A
D	False	7	B
E	False	$3 + 4 = 7$	B
F	False	INF	
G	False	INF	

Lets Run Another Example

Node	Finished	Cost	Prev
A	True	0	
B	True	3	A
C	True	4	A
D	False	7	B
E	False	7	B
F	False	$4 + 4 = 8$	C
G	False	INF	

Lets Run Another Example

Node	Finished	Cost	Prev
A	True	0	
B	True	3	A
C	True	4	A
D	True	7	B
E	False	7	B
F	False	8	C
G	False	INF	

Lets Run Another Example

Node	Finished	Cost	Prev
A	True	0	
B	True	3	A
C	True	4	A
D	True	7	B
E	True	7	B
F	False	8	C
G	False	$7 + 8 = 15$	E

Lets Run Another Example

Node	Finished	Cost	Prev
A	True	0	
B	True	3	A
C	True	4	A
D	True	7	B
E	True	7	B
F	True	8	C
G	False	45 , 8 + 3 = 11	E , F

Lets Run Another Example

Node	Finished	Cost	Prev
A	True	0	
B	True	3	A
C	True	4	A
D	True	7	B
E	True	7	B
F	True	8	C
G	True	11	F

Lets Run Another Example

Node	Finished	Cost	Prev
A	True	0	
B	True	3	A
C	True	4	A
D	True	7	B
E	True	7	B
F	True	8	C
G	True	11	F

Fill in the blanks!

For Task 2, Take a look at the methods `doAddClick` method in BookReviewApp.tsx and fill out the blanks

```
this.doAddResp "/api/add" JSON.stringify({ name })  
this.doAddError("failed to connect to server") "POST"
```

```
fetch(_____, {  
  method: _____,  
  body: _____,  
  headers: { "Content-Type": "application/json" },  
})  
  .then(_____)  
  .catch(() => _____);  
};
```

Fill in the blanks!

```
this.doAddResp "/api/add" JSON.stringify({ name })  
this.doAddError("failed to connect to server") "POST"
```

```
fetch("/api/add", {  
  method: _____,  
  body: _____,  
  headers: { "Content-Type": "application/json" },  
})  
  .then(_____)  
  .catch(() => _____);  
};
```

Fill in the blanks!

```
this.doAddResp "/api/add" JSON.stringify({ name })  
this.doAddError("failed to connect to server") "POST"
```

```
fetch("/api/add", {  
  method: "POST",  
  body: _____,  
  headers: { "Content-Type": "application/json" },  
})  
  .then(_____)  
  .catch(() => _____);  
};
```

Fill in the blanks!

```
this.doAddResp "/api/add" JSON.stringify({ name })  
this.doAddError("failed to connect to server") "POST"
```

```
fetch("/api/add", {  
  method: "POST",  
  body: JSON.stringify({ name }),  
  headers: { "Content-Type": "application/json" },  
})  
  .then(_____)  
  .catch(() => _____);  
};
```

Fill in the blanks!

```
this.doAddResp "/api/add" JSON.stringify({ name })  
this.doAddError("failed to connect to server") "POST"
```

```
fetch("/api/add", {  
  method: "POST",  
  body: JSON.stringify({ name }),  
  headers: { "Content-Type": "application/json" },  
})  
  .then(this.doAddResp)  
  .catch(() => _____);  
};
```

Fill in the blanks!

```
this.doAddResp "/api/add" JSON.stringify({ name })  
this.doAddError("failed to connect to server") "POST"
```

```
fetch("/api/add"_, {  
  method: "POST"_,  
  body: JSON.stringify({ name })_,  
  headers: { "Content-Type": "application/json" },  
})  
  .then(this.doAddResp_)  
  .catch(() => this.doAddError("failed to connect  
to server")_) ;  
};
```

Type Checking of Request/Response

- All our 200 responses are records, so start here
–the `isRecord` function is provided for you

```
if (!isRecord(data)) {  
    console.error("not a record", data);  
    return; } // fail fast and friendly!
```

- Fields of the record can have any types

```
if (typeof data.name !== 'string') {  
    console.error("name is missing or invalid",  
        data);  
    return; }
```

- For Arrays, call `Array.isArray` and then loop through the elements to check `typeof`

The value of the variable “name” in doAddClick is used in which function?

- a) One of the app.post functions in index.ts
- b) addBook(req, res) in routes.ts
- c) doAddResp in BookReviewApp.tsx
- d) doAddJson in BookReviewApp.tsx

The value of the variable “name” in doAddClick is used in which function?

- a) One of the app.post functions in index.ts
- b) addBook(req, res) in routes.ts
- c) doAddResp in BookReviewApp.tsx
- d) doAddJson in BookReviewApp.tsx

Question 2

Now the loading message disappears, and we see an empty list of books, but when we try to add our first book to the list, it doesn't work.

- a) What should the application be doing here, if it were working properly, to add the new book to the list?
- b) What is the bug? (hint: take a look at what is returned from the network request)

Client-Server Communication Debugging Steps

- 1. Do you see the request in the Network tab?**
 - the client didn't make the request
- 2. Does the request show a 404 status code?**
 - the URL is wrong (doesn't match any `app.get` / `app.post`)
or
the query parameters were not encoded properly
- 3. Does the request show a 400 status code?**
 - *your* server rejected the request as invalid
 - look at the body of the response for the error message **or** add `console.log`'s in the server to see what happened
 - the request itself is shown in the Network tab

Client-Server Communication Debugging Steps

- 4. Does the request show a 500 status code?**
 - the server crashed!
 - look in the terminal where you started the server for a stack trace
- 5. Does the request say “pending” forever?**
 - your server forgot to call `res.send` to deliver a response
- 6. Look for an error message in browser Console**
 - if 1-5 don't apply, then the client got back a response
 - client should print an error message if it doesn't like the response
 - client crashing will show a stack trace

If you get a 404 status code in the console, which of the following parts of your code should you inspect?

- a) App methods in index file in the server code
- b) Server function being called in routes
- c) Method that makes the fetch request in the client code
- d) Method that handles response data in the client code
- e) Every single line of code across all files - *might work but takes unnecessary energy* :-(

Quiz Section Feedback

Our goal in section is to help you solidify your understanding and get additional practice the topics covered in lecture, so that you feel confident and prepared to start the homework.

Since it is week 3, we would love to hear your feedback on how things are going. Your input will help us improve everyone's experience section and in 331 in general!

Feedback Questions

- 1) What has been most helpful to you in section so far?
(Walking through coding together, individual or group work time on worksheet problems, review and slides, etc)
- 2) What has been the least helpful part of section for you?
(This is important as we have very limited time to work together in section)
- 3) Which of the following would you like to spend more time on in section?
 - Walking through worksheet problems together
 - Individual or group work time on worksheet problems
 - Slides and concept review
- 4) Any additional comments or suggestions?
(We would love any other ideas or feedback on how section can better support your learning and help you prepare for the homework.)

sec-debug coding exercise

debugging practice !!
