

# CSE332: Data Abstractions

## Lecture 2: Math Review; Algorithm Analysis

Ruth Anderson

Spring 2013

# *Announcements*

- Project 1 posted soon
  - Section materials on Eclipse will be very useful if you have never used it
  - (Could also start in a different environment if necessary)
  - Section materials on generics will be very useful for Phase B
- Homework 1 coming soon (due next Friday)
- Bring info sheet to section tomorrow or lecture on Friday
- Fill out catalyst survey by Thursday evening

# *Today*

- Finish discussing queues
- Review math essential to algorithm analysis
  - Proof by induction
  - Bit patterns
  - Powers of 2
  - Exponents and logarithms
- Begin analyzing algorithms
  - Using asymptotic analysis (continue next time)

# *Mathematical induction*

Suppose  $P(n)$  is some predicate (involving integer  $n$ )

– Example:  $n \geq n/2 + 1$  (for all  $n \geq 2$ )

To prove  $P(n)$  for all integers  $n \geq c$ , it suffices to prove

1.  $P(c)$  – called the “basis” or “base case”
2. If  $P(k)$  then  $P(k+1)$  – called the “induction step” or “inductive case”

We will use induction:

To show an algorithm is correct or has a certain running time  
*no matter how big a data structure or input value is*

(Our “ $n$ ” will be the data structure or input size.)

$P(n) =$  “ the sum of the first  $n$  powers of 2 (starting at  $2^0$ ) is  $2^n - 1$  ”

## *Inductive Proof Example*

Theorem:  $P(n)$  holds for all  $n \geq 1$

Proof: By induction on  $n$

- Base case,  $n=1$ : Sum of first power of 2 is  $2^0$ , which equals 1.  
And for  $n=1$ ,  $2^n - 1$  equals 1.
- Inductive case:
  - Inductive hypothesis: Assume the sum of the first  $k$  powers of 2 is  $2^k - 1$
  - Show, given the hypothesis, that the sum of the first  $(k+1)$  powers of 2 is  $2^{k+1} - 1$

From our inductive hypothesis we know:

$$1 + 2 + 4 + \dots + 2^{k-1} = 2^k - 1$$

Add the next power of 2 to both sides...

$$1 + 2 + 4 + \dots + 2^{k-1} + 2^k = 2^k - 1 + 2^k$$

We have what we want on the left; massage the right a bit

$$1 + 2 + 4 + \dots + 2^{k-1} + 2^k = 2(2^k) - 1 = 2^{k+1} - 1$$

# *Note for homework*

Proofs by induction will come up a fair amount on the homework

When doing them, be sure to state each part clearly:

- What you're trying to prove
- The base case
- The inductive case
- The inductive hypothesis
  - In many inductive proofs, you'll prove the inductive case by just starting with your inductive hypothesis, and playing with it a bit, as shown above

# *N bits can represent how many things?*

# Bits

Patterns

# of patterns

1

2

# *Powers of 2*

- A bit is 0 or 1
- A sequence of  $n$  bits can represent  $2^n$  distinct things
  - For example, the numbers 0 through  $2^n-1$
- $2^{10}$  is 1024 (“about a thousand”, kilo in CSE speak)
- $2^{20}$  is “about a million”, mega in CSE speak
- $2^{30}$  is “about a billion”, giga in CSE speak

Java: an `int` is 32 bits and signed, so “max int” is “about 2 billion”  
a `long` is 64 bits and signed, so “max long” is  $2^{63}-1$

# *Therefore...*

Could give a unique id to...

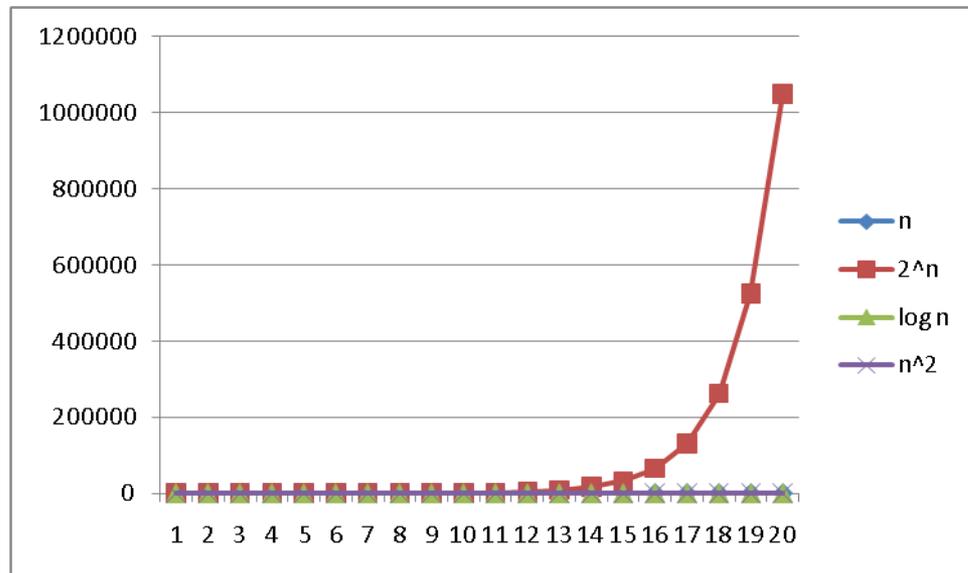

- Every person in the U.S. with 29 bits
- Every person in the world with 33 bits
- Every person to have ever lived with 38 bits (estimate)
- Every atom in the universe with 250-300 bits

So if a password is 128 bits long and randomly generated,  
do you think you could guess it?

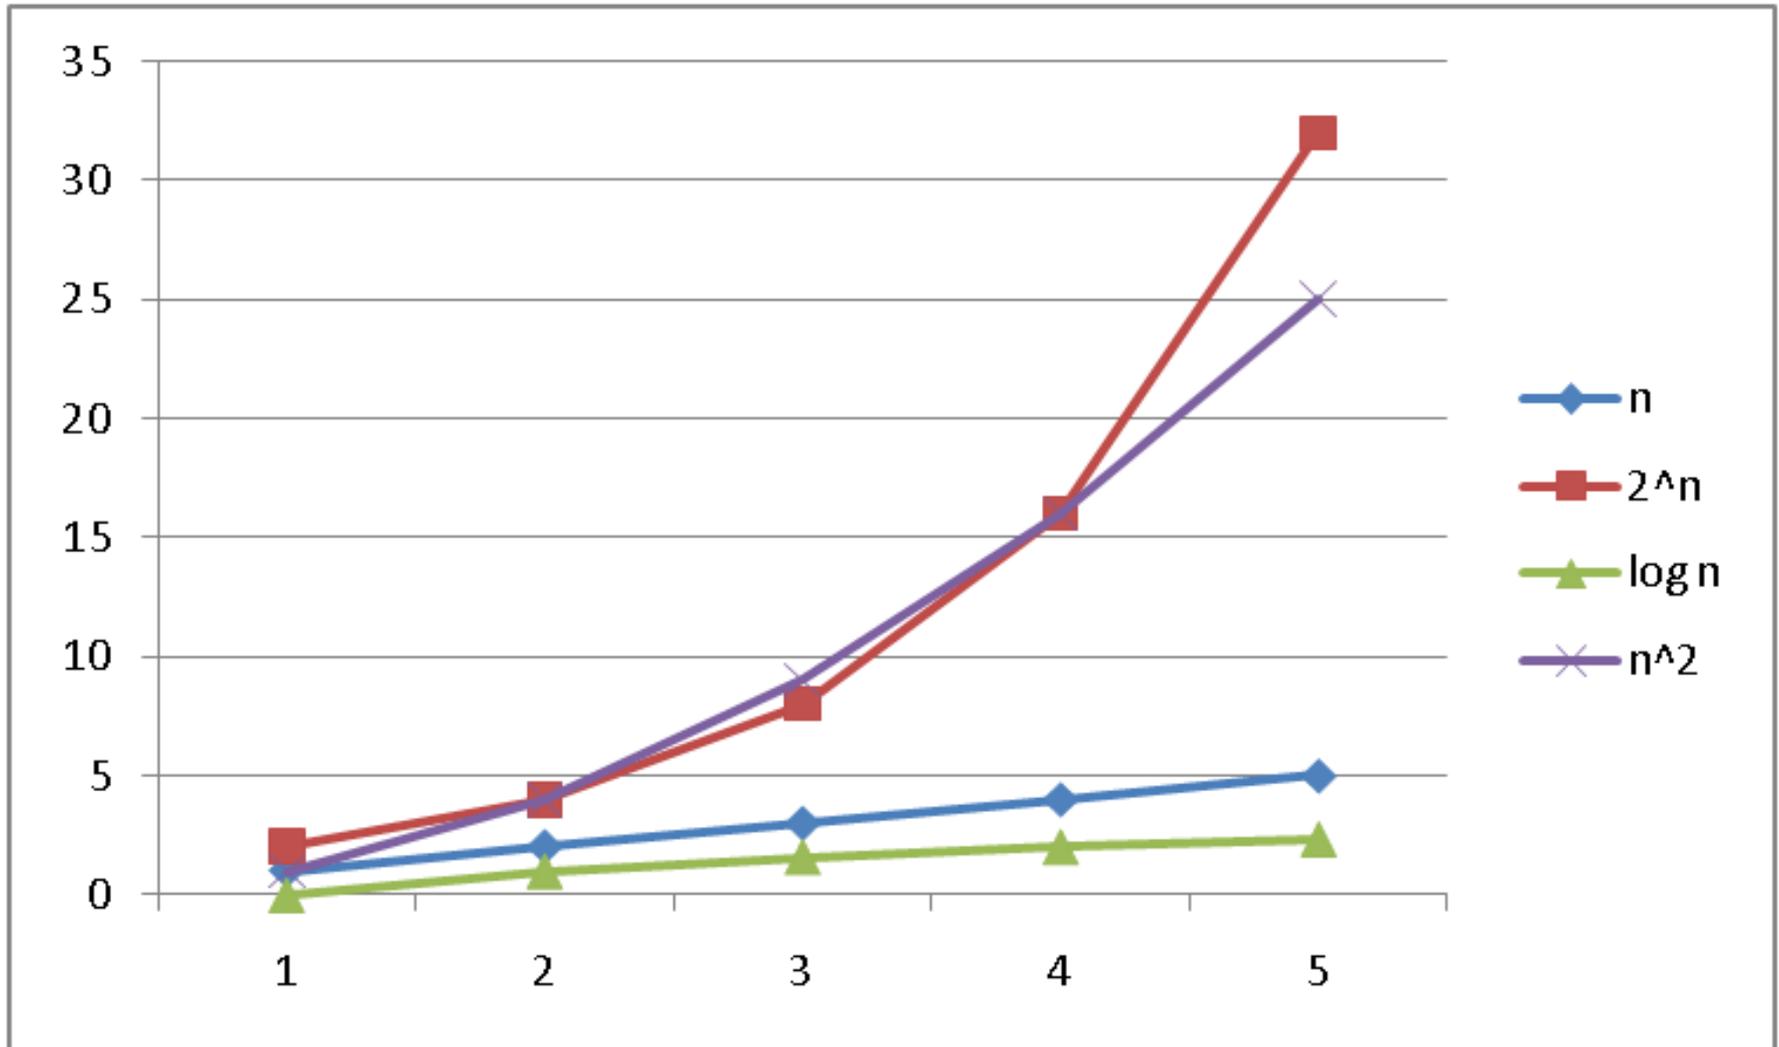

# Logarithms and Exponents

- Since so much is binary in CS,  $\log$  almost always means  $\log_2$
- Definition:  $\log_2 x = y$  if  $x = 2^y$
- So,  $\log_2 1,000,000 =$  “a little under 20”
- Just as exponents grow *very* quickly, logarithms grow *very* slowly

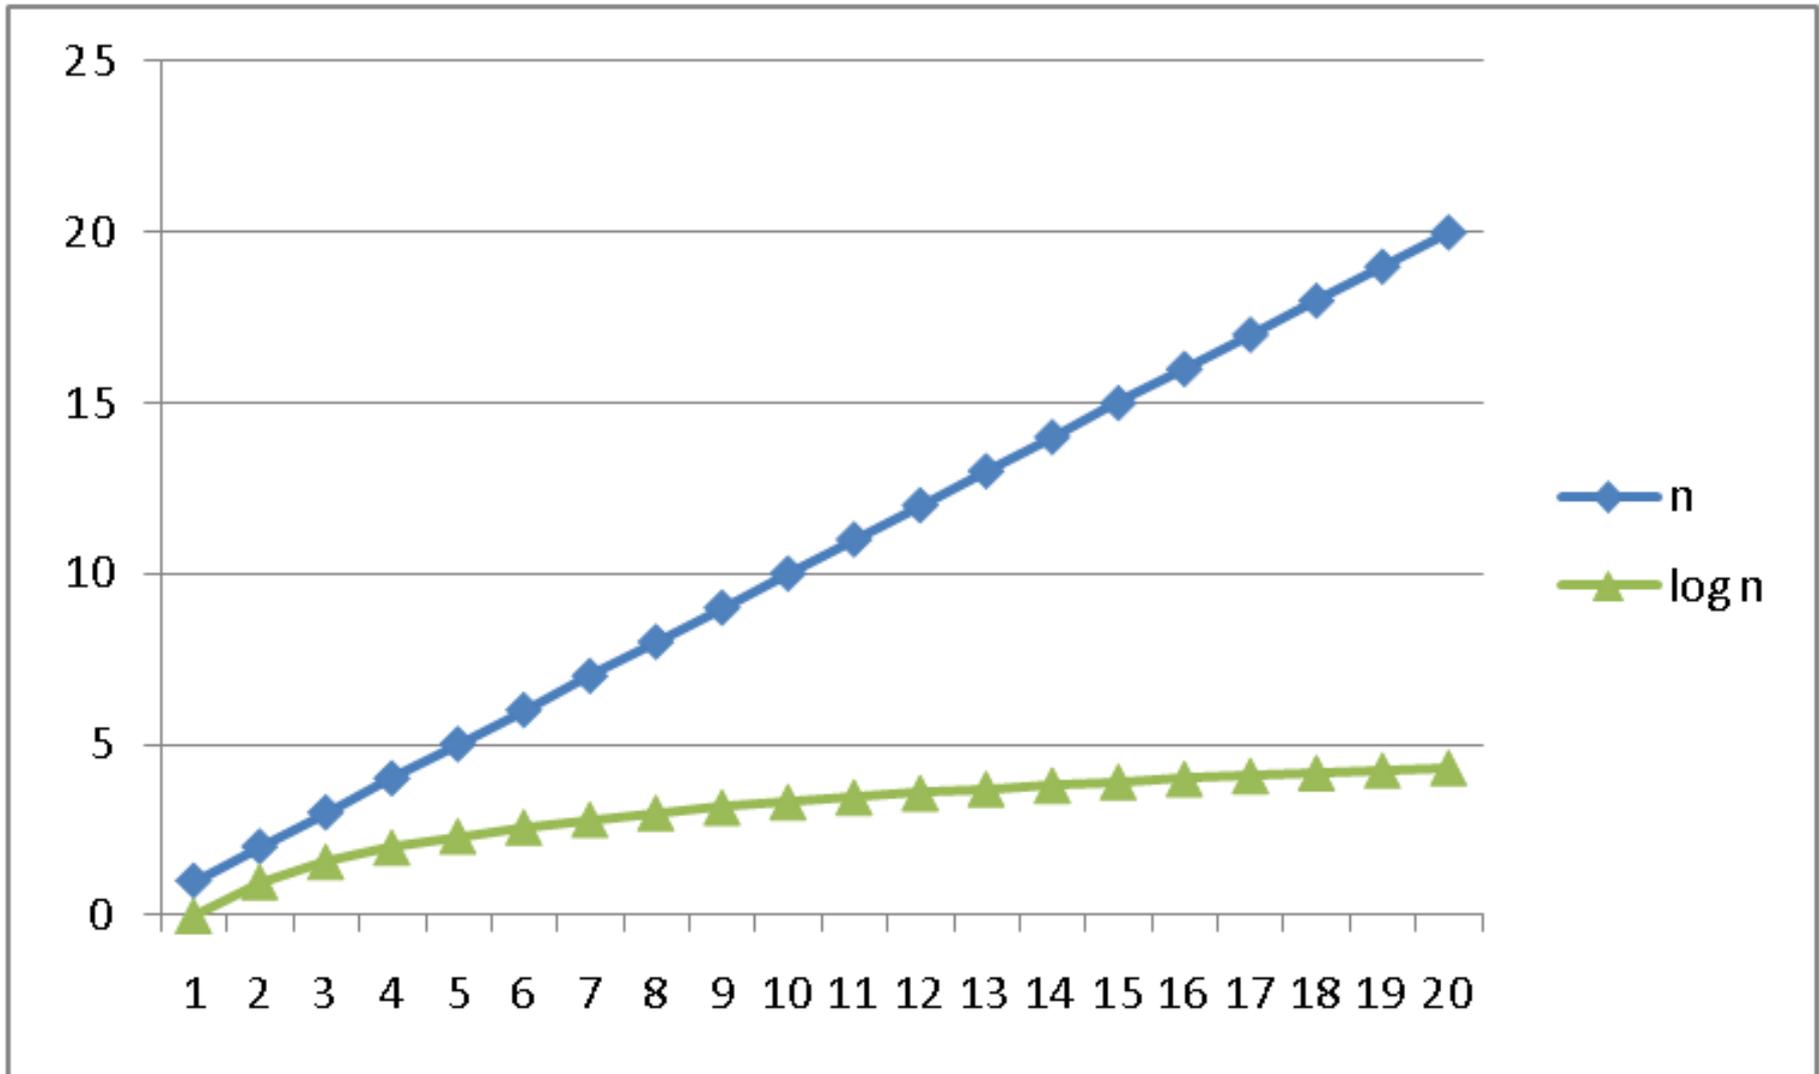

See Excel file  
for plot data –  
play with it!

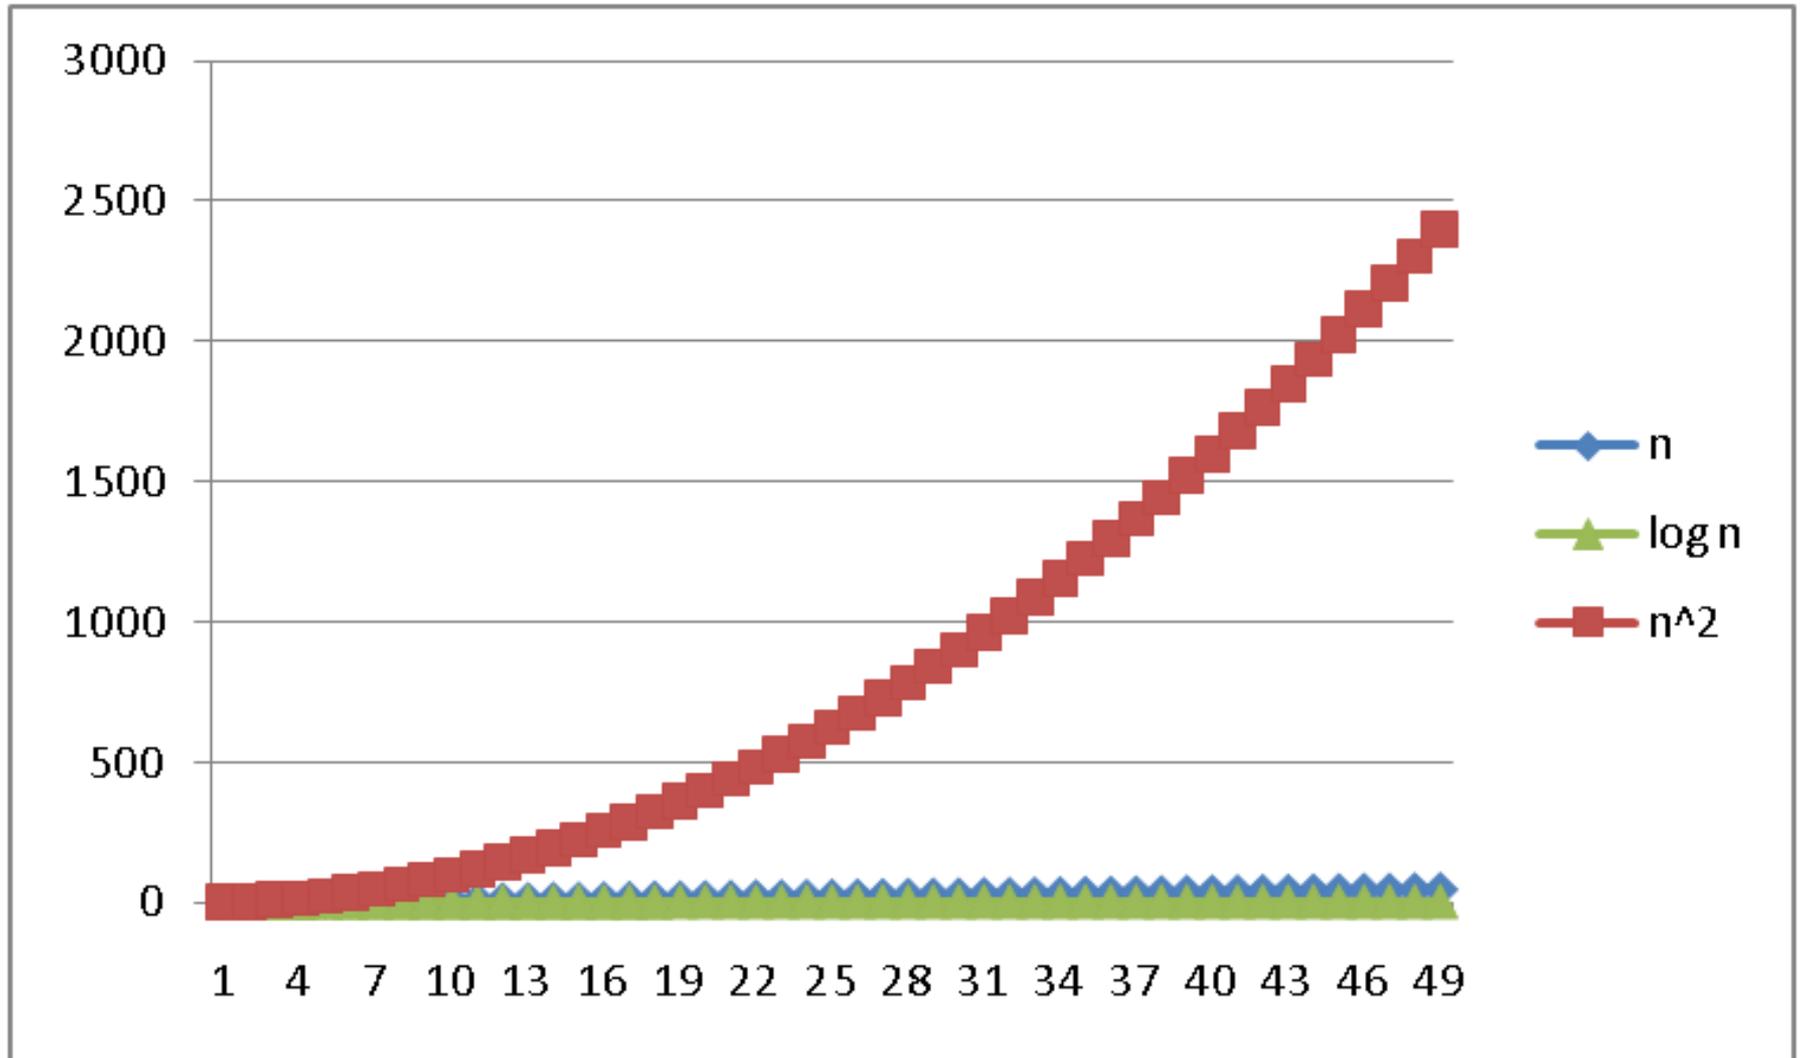

# Logarithms and Exponents

# Logarithms and Exponents

# Logarithms and Exponents

# Properties of logarithms

- $\log(A*B) = \log A + \log B$ 
  - So  $\log(N^k) = k \log N$
- $\log(A/B) = \log A - \log B$
- $x = \log_2 2^x$
- $\log(\log x)$  is written  $\log \log x$ 
  - Grows as slowly as  $2^{2^y}$  grows fast
  - Ex:  
$$\log_2 \log_2 4\text{billion} \sim \log_2 \log_2 2^{32} = \log_2 32 = 5$$
- $(\log x)(\log x)$  is written  $\log^2 x$ 
  - It is greater than  $\log x$  for all  $x > 2$

# *Log base doesn't matter (much)*

“Any base  $B$  log is equivalent to base 2 log within a constant factor”

- And we are about to stop worrying about constant factors!
- In particular,  $\log_2 x = 3.22 \log_{10} x$
- In general, we can convert log bases via a constant multiplier
- Say, to convert from base  $A$  to base  $B$ :

$$\log_B x = (\log_A x) / (\log_A B)$$

# *Algorithm Analysis*

As the “size” of an algorithm’s input grows

(integer, length of array, size of queue, etc.):

- How much longer does the algorithm take (time)
- How much more memory does the algorithm need (space)

Because the curves we saw are so different, we often only care about “which curve we are like”

Separate issue: Algorithm *correctness* – does it produce the right answer for all inputs

- Usually more important, naturally

# Example

- What does this pseudocode return?

```
x := 0;  
for i=1 to N do  
  for j=1 to i do  
    x := x + 3;  
return x;
```

- Correctness: For any  $N \geq 0$ , it returns...

# Example

- What does this pseudocode return?

```
x := 0;  
for i=1 to N do  
  for j=1 to i do  
    x := x + 3;  
return x;
```

- Correctness: For any  $N \geq 0$ , it returns  $3N(N+1)/2$
- Proof: By induction on  $n$ 
  - $P(n)$  = after outer for-loop executes  $n$  times,  $\mathbf{x}$  holds  $3n(n+1)/2$
  - Base:  $n=0$ , returns 0
  - Inductive: From  $P(k)$ ,  $\mathbf{x}$  holds  $3k(k+1)/2$  after  $k$  iterations. Next iteration adds  $3(k+1)$ , for total of  $3k(k+1)/2 + 3(k+1)$   
 $= (3k(k+1) + 6(k+1))/2 = (k+1)(3k+6)/2 = 3(k+1)(k+2)/2$

# Example

- How long does this pseudocode run?

```
x := 0;
for i=1 to N do
  for j=1 to i do
    x := x + 3;
return x;
```

- Running time: For any  $N \geq 0$ ,
  - Assignments, additions, returns take “1 unit time”
  - Loops take the sum of the time for their iterations
- So:  $2 + 2 \cdot (\text{number of times inner loop runs})$ 
  - And how many times is that?

# Example

- How long does this pseudocode run?

```
x := 0;
for i=1 to N do
  for j=1 to i do
    x := x + 3;
return x;
```

- How many times does the **inner loop** run?

# Example

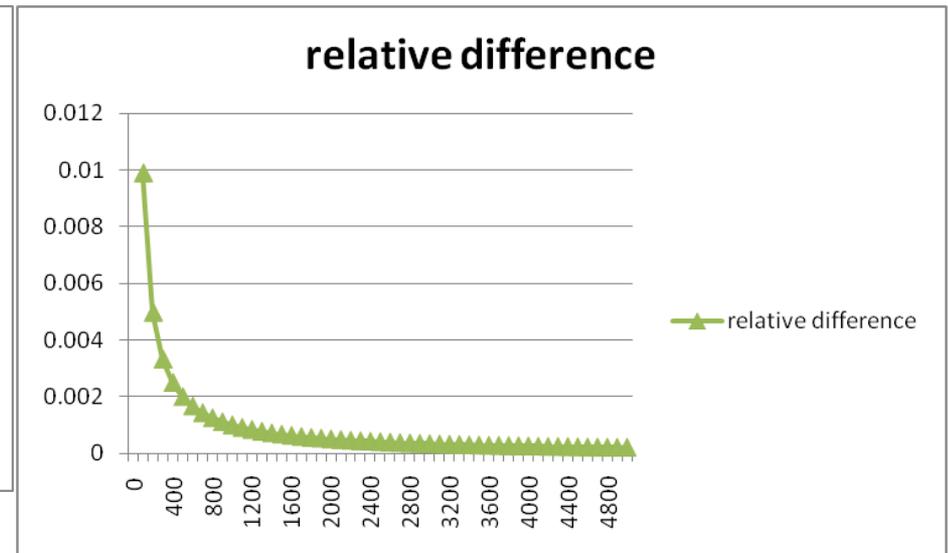

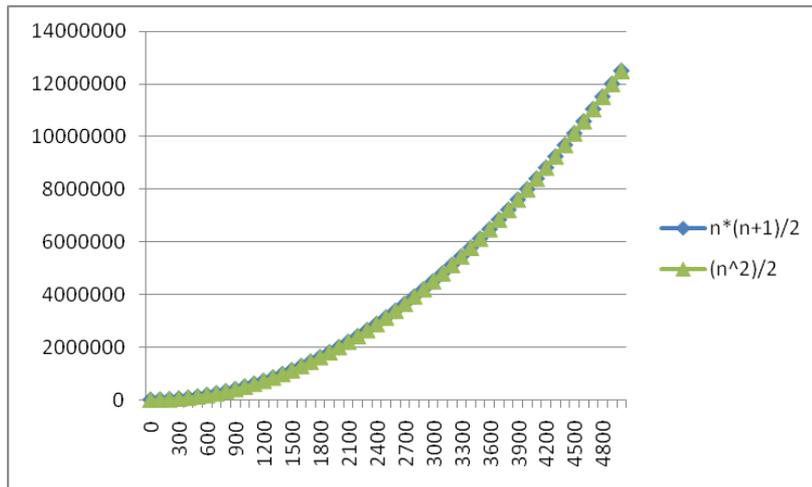

- How long does this pseudocode run?

```
x := 0;
for i=1 to N do
  for j=1 to i do
    x := x + 3;
return x;
```

- The total number of loop iterations is  $N*(N+1)/2$ 
  - This is a very common loop structure, worth memorizing
  - This is *proportional to*  $N^2$  , and we say  $O(N^2)$ , “big-Oh of”
    - For large enough  $N$ , the  $N$  and constant terms are irrelevant, as are the first assignment and return
    - See plot...  $N*(N+1)/2$  vs. just  $N^2/2$

# Lower-order terms don't matter

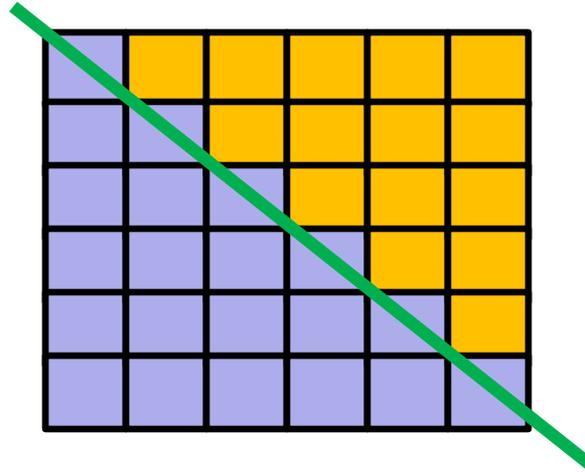

$N*(N+1)/2$  vs. just  $N^2/2$

# Geometric interpretation

$$\sum_{i=1}^N i = N*N/2 + N/2$$

```
for i=1 to N do
  for j=1 to i do
    // small work
```

- Area of square:  $N*N$
- Area of lower triangle of square:  $N*N/2$
- Extra area from squares crossing the diagonal:  $N*1/2$
- As  $N$  grows, fraction of “extra area” compared to lower triangle goes to zero (becomes insignificant)

# Recurrence Equations

- For running time, what the loops did was irrelevant, it was how many times they executed.
- Running time as a function of input size  $n$  (here loop bound):  
$$T(n) = n + T(n-1)$$

(and  $T(0) = 2$ ish, but usually implicit that  $T(0)$  is some constant)
- Any algorithm with running time described by this formula is  $O(n^2)$
- “Big-Oh” notation also ignores the constant factor on the high-order term, so  $3N^2$  and  $17N^2$  and  $(1/1000) N^2$  are all  $O(N^2)$ 
  - As  $N$  grows large enough, no smaller term matters
  - Next time: Many more examples + formal definitions

# *Big-O: Common Names*

$O(1)$	constant (same as $O(k)$ for constant $k$ )
$O(\log n)$	logarithmic
$O(n)$	linear
$O(n \log n)$	“ $n \log n$ ”
$O(n^2)$	quadratic
$O(n^3)$	cubic
$O(n^k)$	polynomial (where $k$ is a constant)
$O(k^n)$	exponential (where $k$ is any constant $> 1$ )

“exponential” does not mean “grows really fast”, it means “grows at rate proportional to  $k^n$  for some  $k > 1$ ”
