

#### CSE 332: Data Structures & Parallelism

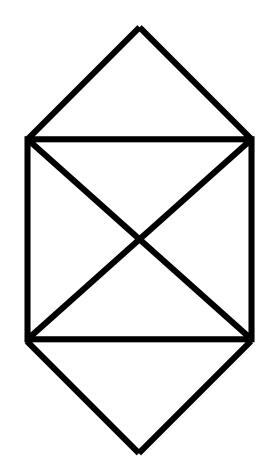

Lecture 24: P, NP, NP-Complete (part 1)

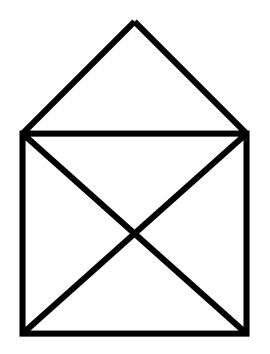

Ruth Anderson Autumn 2018

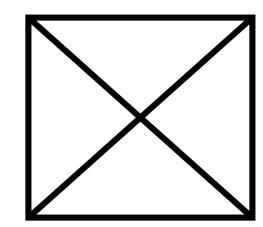

### Agenda (for next 2 lectures)

- A Few Problems:
  - Euler Circuits
  - Hamiltonian Circuits
- Intractability: P and NP
- NP-Complete
- What now?

### Try it!

Which of these can you draw (trace all edges) without lifting your pencil, drawing each line only once?

Can you start and end at the same point?

#### Your First Task

- Your company has to inspect a set of roads between cities by driving over each of them.
- Driving over the roads costs money (fuel), and there are a lot of roads.

 Your boss wants you to figure out how to <u>drive</u> over each road exactly once, returning to your starting point.

#### **Euler Circuits**

- <u>Euler circuit</u>: a path through a graph that visits each edge exactly once and starts and ends at the same vertex
- Named after Leonhard Euler (1707-1783), who cracked this problem and founded graph theory in 1736
- An <u>Euler circuit</u> exists iff
  - the graph is connected and
  - each vertex has even degree (= # of edges on the vertex)

### The Road Inspector: Finding Euler Circuits

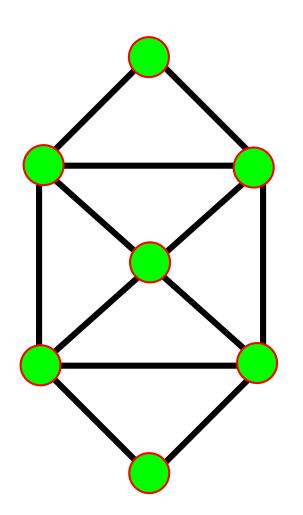

Given a connected, undirected graph G = (V,E), find an Euler circuit in G

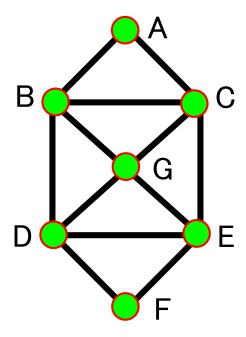

#### Can check if one exists:

Check if all vertices have even degree

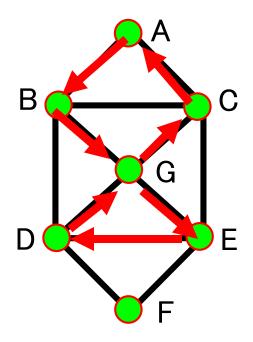

#### Basic Euler Circuit Algorithm:

- 1. Do an edge walk from a start vertex until you are back to the start vertex.
  - You never get stuck because of the even degree property.
- 2. "Remove" the walk, leaving several components each with the even degree property.
  - Recursively find Euler circuits for these.
- 3. Splice all these circuits into an Euler circuit

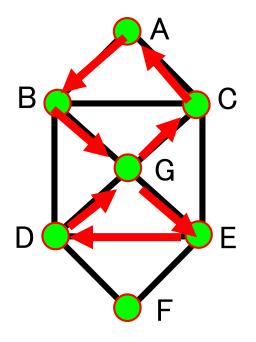

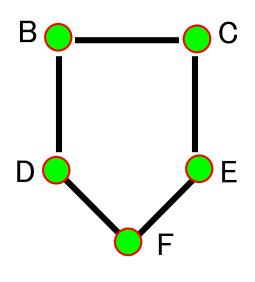

Euler(A):

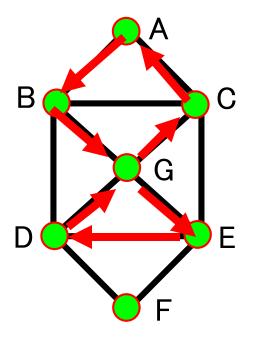

Euler(A):
ABGEDGCA

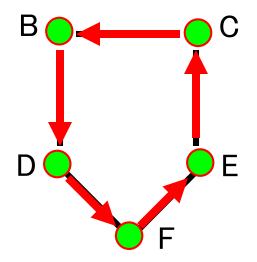

Euler(A):
ABGEDGCA

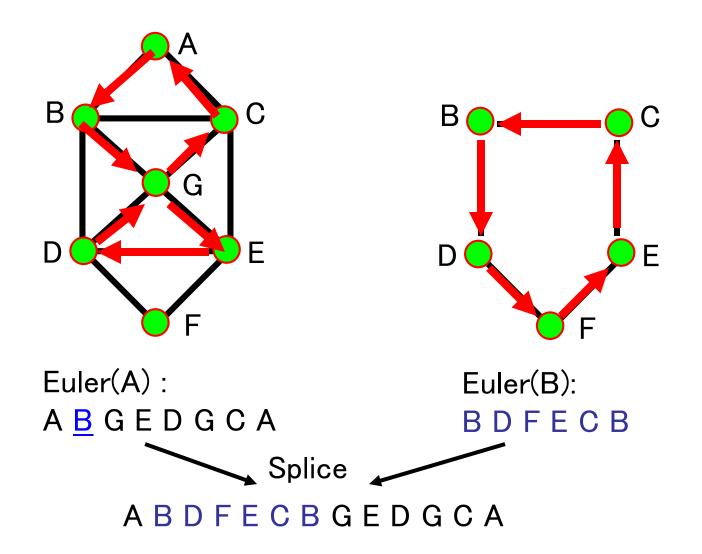

Euler(B)

Euler(A):
A B G E D G C A

Euler(B): B D F E C B

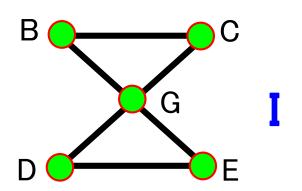

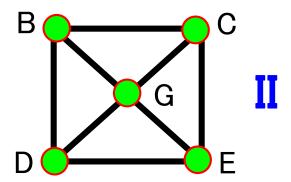

#### Your Second Task

- Your boss is pleased...and assigns you a new task.
- Your company has to send someone by car to a set of cities.
- The primary cost is the exorbitant toll going into each city.
- Your boss wants you to figure out <u>how to drive to each city exactly once</u>, returning in the end to the city of origin.

#### Hamiltonian Circuits

- Euler circuit: A cycle that goes through each edge exactly once
- Hamiltonian circuit: A cycle that goes through each vertex exactly once
- Does graph I have:
  - An Euler circuit?
  - A Hamiltonian circuit?
- Does graph II have:
  - An Euler circuit?
  - A Hamiltonian circuit?
- Which problem sounds harder?

### Finding Hamiltonian Circuits

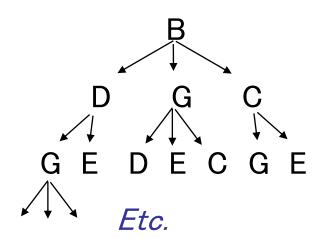

- Problem: Find a Hamiltonian circuit in a connected, undirected graph G
- One solution: Search through all paths to find one that visits each vertex exactly once
  - Can use your favorite graph search algorithm to find paths
- This is an exhaustive search ("brute force") algorithm
- Worst case: need to search all paths
  - How many paths??

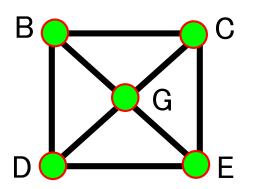

### Analysis of Exhaustive Search Algorithm

Worst case: need to search all paths

– How many paths?

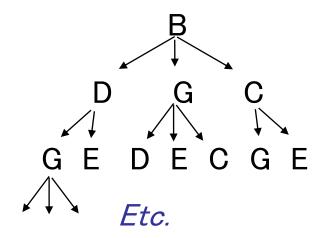

Can depict these paths as a search tree:

### Analysis of Exhaustive Search Algorithm

- Let the average branching factor of each node in this tree be b
- |V| vertices, each with ≈ b branches
- Total number of paths ≈ b·b·b ... ·b

Worst case →

Search tree of paths from B

# **Running Times**

## More Running Times

**Table 2.1** The running times (rounded up) of different algorithms on inputs of increasing size, for a processor performing a million high-level instructions per second. In cases where the running time exceeds  $10^{25}$  years, we simply record the algorithm as taking a very long time.

	п	$n \log_2 n$	$n^2$	$n^3$	1.5 <sup>n</sup>	2 <sup>n</sup>	n!
n = 10	< 1 sec	< 1 sec	< 1 sec	< 1 sec	< 1 sec	< 1 sec	4 sec
n = 30	< 1 sec	< 1 sec	< 1 sec	< 1 sec	< 1 sec	18 min	10 <sup>25</sup> years
n = 50	< 1 sec	< 1 sec	< 1 sec	< 1 sec	11 min	36 years	very long
n = 100	< 1 sec	< 1 sec	< 1 sec	1 sec	12,892 years	$10^{17}$ years	very long
n = 1,000	< 1 sec	< 1 sec	1 sec	18 min	very long	very long	very long
n = 10,000	< 1 sec	< 1 sec	2 min	12 days	very long	very long	very long
n = 100,000	< 1 sec	2 sec	3 hours	32 years	very long	very long	very long
n = 1,000,000	1 sec	20 sec	12 days	31,710 years	very long	very long	very long

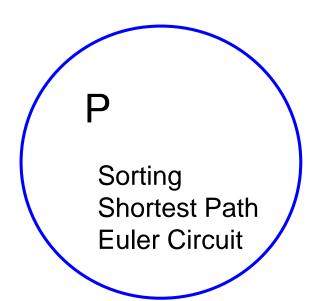

### Polynomial vs. Exponential Time

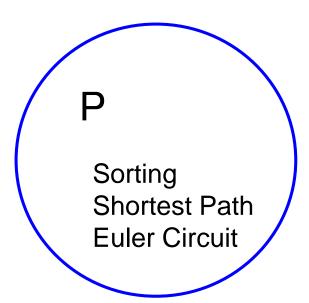

- All of the algorithms we have discussed in this class have been polynomial time algorithms:
  - Examples: O(log N), O(N), O(N log N), O(N<sup>2</sup>)
  - Algorithms whose running time is O(N<sup>k</sup>) for some k > 0
- Exponential time b<sup>N</sup> is asymptotically worse than any polynomial function N<sup>k</sup> for any k

### The Complexity Class P

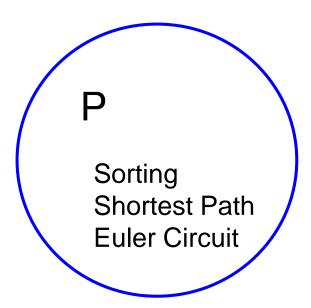

- P is the set of all problems that can be solved in polynomial worst case time
  - All *problems* that have some *algorithm* whose running time is  $O(N^k)$  for some k

 Examples of problems in P: sorting, shortest path, Euler circuit, etc.

#### Hamiltonian Circuit

Hamiltonian Circuit Satisfiability (SAT) Vertex Cover Travelling Salesman

### Satisfiability

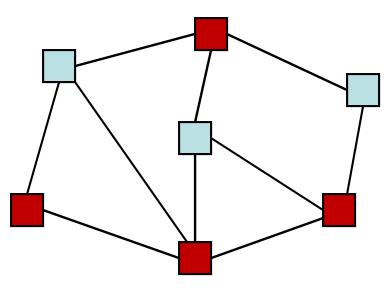

$$(\neg x_1 \lor x_2 \lor x_4) \land (x_1 \lor \neg x_3 \lor x_4) \land (x_2 \lor \neg x_4 \lor \neg x_5)$$

Input: a logic formula of size m containing n variables

Output: An assignment of Boolean values to the variables in the formula such that the formula is true

Algorithm: Try every variable assignment

#### Vertex Cover:

Input: A graph (V,E) and a number m

Output: A subset **S** of **V** such that <u>for every edge</u> (**u**,**v**) in **E**, at least <u>one</u> of **u** or **v** is in **S** and |**S**|=**m** (if such an **S** exists)

Algorithm: Try every subset of vertices of size **m** 

### Traveling Salesman

Input: A complete weighted graph (V,E) and a number m

Output: A circuit that visits each vertex exactly once and has

total cost < **m** if one exists

Algorithm: Try every path, stop if find cheap enough one
