CSE 332 Winter 2018 Final Exam

(closed book, closed notes, no calculators)

Instructions: Read the directions for each question carefully before answering. We may give partial credit based on the work you **write down**, so show your work! Use only the data structures and algorithms we have discussed in class so far. Writing after time has been called will result in a loss of points on your exam.

Note: For questions where you are drawing pictures, please circle your final answer.

You have 1 hour and 50 minutes, work quickly and good luck!

Total: Time: 1 hr and 50 minutes.

1) [12 points total] Hash Tables

For a) and b) below, insert the following elements in this order: 14, 22, 33, 44, 13, 73, 28. For each table, TableSize = 10, and you should use the primary hash function h(k) = k% 10. If an item cannot be inserted into the table, please indicate this and continue inserting the remaining values.

- a) Separate chaining hash table use a sorted linked list for each bucket where the values are ordered by increasing value
- b) Quadratic probing hash table

- c) What is the load factor in Table b)?
- d) In a sentence or two, describe **double hashing**.

- e) What is **re-hashing**? Would it be beneficial to implement **re-hashing** on a separate chaining hash table like the one shown above in part a)? Why or Why not?
- f) What is one **disadvantage** quadratic probing has compared to linear probing?

2) [9 points total] Graphs!

a) [6 points] Find a minimum spanning tree with Prim's algorithm <u>using vertex G as the starting node</u> (mark, circle, or highlight edges below to indicate they are in your minimum spanning tree). You <u>must show your steps</u> in the table below for full credit. Show your steps by crossing through values that are replaced by a new value. Break ties by choosing the lowest letter first; ex. if B and C were tied, you would explore B first. Note that the next question asks you to recall what order vertices were declared known.

	Cost	Prev	Known?
A			
В			
C			
D			
E			
F			
G			

b) [1 point] List the order the vertices are added to the known set:

c) [1 point] Pick a node you could start at to get a *different minimum spanning tree* than the one you found in part a). Which edge would be in this new tree that is *not* in your tree above? <u>DO NOT DRAW THE WHOLE TREE.</u>

Starting node (for example, "Z"):	Edge (for example, "(X, Y)"):	
-----------------------------------	--------------------------------------	--

d) [1 point] Will Prim's starting at vertex G find a correct minimum spanning tree if the weight of edge (A,F) is set to be -6? (circle one)

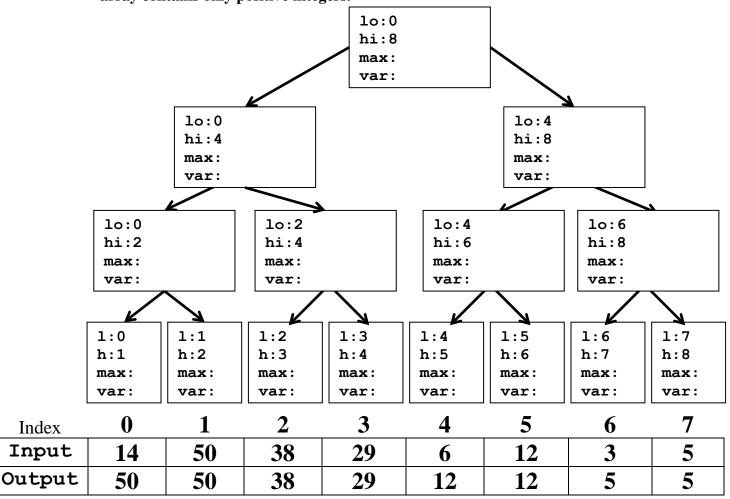

YES NO

_	points] If you needed to calculate the out-dependentation would you prefer (circle one):	gree of all vertices	in a grapl	h, which
repres	entation would you pieter (energone).	adjacency mat	rix or	adjacency list
In a co	ouple of sentences describe WHY?			
_	points] Give an example of a directed graph ode of in-degree zero.	with exactly two t	opologica	l orderings and
follow	point] Let G be a connected, undirected, we was: replace every undirected edge (u, v) with ing graph is strongly connected.		-> v) and	
d) [4 r that:	points] What is the worst case running time of i. Does NOT use a priority queue:	of Dijkstra's algor	ithm desc	ribed in lecture
	ii. Uses a priority queue:			
e) [2 p	points] Give an EXACT number (in terms of	V) for:		
	i. Maximum number of edges in an undirect	cted graph without	self-loop	s:
	ii. Minimum number of edges in a weakly	connected directed	l graph	

3) [11 points total] More Graphs!

4) [10 points] Parallel "Suffix Max" (Like Prefix, but from the Right instead):

a) Given the following array as input, calculate the "suffix max" using an algorithm similar to the parallel prefix algorithm discussed in lecture. Fill the **output** array with the max of the values **contained in all of the cells to the right** (including the value contained in that cell) in the input array. The first pass of the algorithm is similar to the first pass of the parallel prefix code you have seen before. Fill in the values for max and var in the tree below. The output array has been filled in for you. Do not use a sequential cutoff. You can assume that the array contains only positive integers.

b) How is the **var** value computed for the left and right children of a node in the tree. Give **exact code** (not just an English description) where **p** is a reference to the current tree node.

Index

p.right.var =

c) How is **output[i]** computed? Give **exact code** assuming **leaves[i]** refers to the leaf node in the tree visible just above the corresponding location in the input and output arrays in the picture above.

- 5) [14 points] In Java using the ForkJoin Framework, write code to solve the following problem:
 - Input: An array of positive ints
- Output: an array of 10 ints containing a count of the ones place digits of the values in the Input array. The count of digit i will be in Output[i].

For example, if the input array is $\{200\underline{7}, 1\underline{3}, 1\underline{7}, 2\underline{4}, \underline{5}, 1\underline{7}, 3\underline{8}, 40\underline{7}, \underline{0}, \underline{7}, \underline{4}, 1\underline{7}\}$, the output array (always containing exactly 10 ints) would be $\{1, 0, 0, 1, 2, 1, 0, 6, 1, 0\}$.

- Do **not** employ a sequential cut-off: **the base case should process one element**. (You can assume the input array will contain at least one element.)
- Give a class definition, CountOnesPlaceTask, along with any other code or classes needed.
- Fill in the function findOnesPlaces below.

You may not use any global data structures or synchronization primitives (locks).

```
a) Write the code.
b) Answer this: Is this a map or a reduction (circle one)? Why?
```

```
import java.util.concurrent.ForkJoinPool;
import java.util.concurrent.RecursiveTask;
import java.util.concurrent.RecursiveAction;

class Main{
    public static final ForkJoinPool fjPool = new ForkJoinPool();

    // Returns an array of 10 ints. Where the ith element
    // contains a count of the number of times i appears in
    // the ones place in the values in input.
    public static int[] findOnesPlaces (int[] input) {
```

Please fill in the function above and write your class on the next page.

Don't forget to answer b) on the previous page!

5) (Continued) Write your class on this page.

6) [13 points] Concurrency: The following class implements a Bank account class that keeps track of multiple Bank Accounts a user might have. Multiple threads could be accessing the same BankAccounts object.

```
public class BankAccounts {
     private Map<String, Double> acctsMap = new HashMap<>();
     // Returns null if account does not exist
     public Double getBalance(String acctName) {
           return acctsMap.get(acctName);
     }
     public Double withdraw(String acctName, Double amount) {
           Double acctBalance = getBalance(acctName);
           if (acctBalance == null || acctBalance < amount) {</pre>
                throw new InvalidTransactionException();
           }
           acctsMap.put(acctName, acctBalance - amount);
           return amount;
     }
     // Deposit amount in acctName
     // Creates acctName if it does not already exist
     public void deposit(String acctName, Double amount) {
           Double acctBalance = getBalance(acctName);
           if (acctBalance == null) {
                acctBalance = 0.0;
           }
           acctsMap.put(acctName, acctBalance + amount);
     }
}
```

6) (Continued) a) Does the BankAccounts class above have (circle all that apply):							
a race condition,	potential for deadlock,	a data race,	none of these				
If there are any probler	ms, describe them in 1-2 ser	ntences.					
	ne withdraw method sync ied BankAccounts class a		_				
	_		_				
code. Does this modification arace condition, If there are any FIXED	potential for deadlock,	above have (circle a	all that apply):				
code. Does this modification arace condition, If there are any FIXED	potential for deadlock, problems, describe why the	above have (circle a	all that apply): none of these				
code. Does this modification arace condition, If there are any FIXED	potential for deadlock, problems, describe why the	above have (circle a	all that apply): none of these				
code. Does this modification arace condition, If there are any FIXED	potential for deadlock, problems, describe why the	above have (circle a	all that apply): none of these				

c) Modify the <u>code on the previous page</u> to use locks to avoid any of the potential problems listed above. Create locks as needed. Use any reasonable names for the locking methods you use. <u>DO NOT use synchronized</u>. You should create re-entrant lock objects as needed as follows (place this in your code as needed):

ReentrantLock lock = new ReentrantLock();

d) Clearly circle all of the **critical sections** in your **code on the previous page**.

,	[16 points] Sorting [2 points] Give the <u>recurrence</u> for SEQUENTIAL Mergesort – worst case: (Note: We are NOT asking for the closed form.)
b)	[3 points] Give the <u>recurrence</u> for Quicksort (parallel sort & parallel partition) – worst case span: (Note: We are NOT asking for the closed form.)
c)	[5 points] Give the big-O runtimes requested below.
	A) Quicksort (parallel sort & parallel partition) – best case span
	B) Heapsort – worst case
	C) Insertion Sort – worst case
	D) Bucket Sort – best case
	E) Mergesort (sequential) – worst case
d)	[1 point] Is the version of Quicksort described in lecture a stable sort?
	YES NO
e)	[2 points] In 1-2 sentences, describe what it means for a sort to be stable?
f)	[3 points] Radix Sort: Give a formula for the worst case big-O running time of radix sort. For full credit, your formula should include all of these variables:
	n — the number of values to be sorted max_value — the values to be sorted range from 0 to max_value radix — the radix or base to be used in the sort
	Answer:

8	19	points]	P.	NP.	NP-	Com	plete
Ο,	<i>,</i> L –	Pomico	,	· · · · •	T 4 T	COIII	picto

a) [2 points] "NP" stands for

b) [2 points] What does it mean for a problem to be in NP?

c) [5 points] For the following problems, circle ALL the sets they (most likely) belong to:

Finding the shortest path from overtex to another vertex in a	one			
weighted directed graph	NP	P	NP-complete	None of these
Finding a cycle that visits each edge in a graph	110		ND 1	
exactly once	NP	P	NP-complete	None of these
Determining if a program will run forever	NP	P	NP-complete	None of these
Finding the prefix sum of an array in parallel using 10 processors	NP	P	NP-complete	None of these
Finding a path that starts and ends at the same vertex that visits every vertex exactly				
once	NP	P	NP-complete	None of these

9) [6 points] Speedup

Your boss wants 111x speedup on a program of which 9/10 is parallelizable. What do you tell them? At least how many processors would you need?

Justify your answer with a computation. No credit given without an explanation.
