# CSE 332: Data Structures \& Parallelism Lecture 24: P, NP, NP-Complete (part 1) 

Ruth Anderson

Winter 2018

## Agenda (for next 2 lectures)

- A Few Problems:
- Euler Circuits
- Hamiltonian Circuits
- Intractability: P and NP
- NP-Complete
- What now?

## Try it!

Which of these can you draw (trace all edges) without lifting your pencil, drawing each line only once?
Can you start and end at the same point?

## Your First Task

- Your company has to inspect a set of roads between cities by driving over each of them.
- Driving over the roads costs money (fuel), and there are a lot of roads.
- Your boss wants you to figure out how to drive over each road exactly once, returning to your starting point.

## Euler Circuits

- Euler circuit: a path through a graph that visits each edge exactly once and starts and ends at the same vertex
- Named after Leonhard Euler (1707-1783), who cracked this problem and founded graph theory in 1736
- An Euler circuit exists iff
- the graph is connected and
- each vertex has even degree (= \# of edges on the vertex)

## The Road Inspector: Finding Euler Circuits

Given a connected, undirected graph $G=(\mathrm{V}, \mathrm{E})$, find an Euler circuit in G

Can check if one exists:

- Check if all vertices have even degree

Basic Euler Circuit Algorithm:

1. Do an edge walk from a start vertex until you are back to the start vertex.

- You never get stuck because of the even degree property.

2. "Remove" the walk, leaving several components each with the even degree property.

- Recursively find Euler circuits for these.

3. Splice all these circuits into an Euler circuit

Running time?

## The Road Inspector: Finding Euler Circuits

Given a connected, undirected graph $G=(\mathrm{V}, \mathrm{E})$, find an Euler circuit in G

Can check if one exists: (in $\mathrm{O}(|\mathrm{V}|+|\mathrm{E}|)$ )

- Check if all vertices have even degree

Basic Euler Circuit Algorithm:

1. Do an edge walk from a start vertex until you are back to the start vertex.

- You never get stuck because of the even degree property.

2. "Remove" the walk, leaving several components each with the even degree property.

- Recursively find Euler circuits for these.

3. Splice all these circuits into an Euler circuit

Running time? $\mathrm{O}(|\mathrm{V}|+|\mathrm{E}|)$

## Euler Circuit Example

Euler(A) :

Splice

## Your Second Task

- Your boss is pleased...and assigns you a new task.
- Your company has to send someone by car to a set of cities.
- The primary cost is the exorbitant toll going into each city.
- Your boss wants you to figure out how to drive to each city exactly once, returning in the end to the city of origin.

## Hamiltonian Circuits

- Euler circuit: A cycle that goes through each edge exactly once
- Hamiltonian circuit: A cycle that goes through each vertex exactly once

I

- Does graph I have:
- An Euler circuit?
- A Hamiltonian circuit?
- Does graph II have:
- An Euler circuit?
- A Hamiltonian circuit?

II

- Which problem sounds harder?

## Finding Hamiltonian Circuits

- Problem: Find a Hamiltonian circuit in a connected, undirected graph G
- One solution: Search through all paths to find one that visits each vertex exactly once
- Can use your favorite graph search algorithm to find paths
- This is an exhaustive search ("brute force") algorithm
- Worst case: need to search all paths
- How many paths??

## Analysis of Exhaustive Search Algorithm

Worst case: need to search all paths

- How many paths?

Can depict these paths as a
 search tree:

## Analysis of Exhaustive Search Algorithm

- Let the average branching factor of each node in this tree be b
- $|\mathrm{V}|$ vertices, each with $\approx b$ branches
- Total number of paths $\approx b \cdot b \cdot b \ldots \cdot b$

- Worst case $\rightarrow$

Search tree of paths from B

## Analysis of Exhaustive Search Algorithm

- Let the average branching factor of each node in this tree be b
- $|\mathrm{V}|$ vertices, each with $\approx b$ branches
- Total number of paths $\approx b \cdot b \cdot b \ldots \cdot b$ $=\mathrm{O}\left(\mathrm{b}^{|\mathrm{V}|}\right)$

- Worst case $\rightarrow$ Exponential time!

Search tree of paths from B

## Running Times

## More Running Times

Table 2.1 The running times (rounded up) of different algorithms on inputs of increasing size, for a processor performing a million high-level instructions per second. In cases where the running time exceeds $10^{25}$ years, we simply record the algorithm as taking a very long time.

|  | $n$ | $n \log _{2} n$ | $n^{2}$ | $n^{3}$ | $1.5^{n}$ | $2^{n}$ | $n!$ |
| :---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=10$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | 4 sec |
| $n=30$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | 18 min | $10^{25}$ years |
| $n=50$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | 11 min | 36 years | very long |
| $n=100$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | 1 sec | 12,892 years | $10^{17}$ years | very long |
| $n=1,000$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | 1 sec | 18 min | very long | very long | very long |
| $n=10,000$ | $<1 \mathrm{sec}$ | $<1 \mathrm{sec}$ | 2 min | 12 days | very long | very long | very long |
| $n=100,000$ | $<1 \mathrm{sec}$ | 2 sec | 3 hours | 32 years | very long | very long | very long |
| $n=1,000,000$ | 1 sec | 20 sec | 12 days | 31,710 years | very long | very long | very long |

Somewhat old, from Rosen

## Polynomial vs. Exponential Time

- All of the algorithms we have discussed in this class have been polynomial time algorithms:
- Examples: $\mathrm{O}(\log \mathrm{N}), \mathrm{O}(\mathrm{N}), \mathrm{O}(\mathrm{N} \log \mathrm{N}), \mathrm{O}\left(\mathrm{N}^{2}\right)$
- Algorithms whose running time is $\mathrm{O}\left(\mathrm{N}^{\mathrm{k}}\right)$ for some k > 0
- Exponential time $b^{N}$ is asymptotically worse than any polynomial function $\mathrm{N}^{\mathrm{k}}$ for any k

## The Complexity Class P

- $P$ is the set of all problems that can be solved in polynomial worst case time
- All problems that have some algorithm whose running time is $\mathrm{O}\left(\mathrm{N}^{k}\right)$ for some $k$
- Examples of problems in P: sorting, shortest path, Euler circuit, etc.

Hamiltonian Circuit

## Satisfiability

$$
\left(\neg x_{1} \vee x_{2} \vee x_{4}\right) \wedge\left(x_{1} \vee \neg x_{3} \vee x_{4}\right) \wedge\left(x_{2} \vee \neg x_{4} \vee \neg x_{5}\right)
$$

Input: a logic formula of size $\mathbf{m}$ containing $\mathbf{n}$ variables
Output: An assignment of Boolean values to the variables in the formula such that the formula is true

Algorithm: Try every variable assignment

## Vertex Coner.

Input: A graph (V,E) and a number m

Output: A subset $\mathbf{S}$ of $\mathbf{V}$ such that for every edge (u,v) in $\mathbf{E}$, at least one of $\mathbf{u}$ or $\boldsymbol{v}$ is in $\mathbf{S}$ and $|\mathbf{S}|=\mathbf{m}$ (if such an $\mathbf{S}$ exists)

Algorithm: Try every subset of vertices of size m

## Traveling Salesman

Input: A complete weighted graph (V,E) and a number m
Output: A circuit that visits each vertex exactly once and has total cost < $\mathbf{m}$ if one exists

Algorithm: Try every path, stop if find cheap enough one
