

### CSE 332: Data Structures & Parallelism

Lecture 25: P, NP, NP-Complete (part 2)

Ruth Anderson Spring 2023

# Today's Agenda

- A Few Problems:
  - Euler Circuits
  - Hamiltonian Circuits
- Intractability: P and NP
- NP-Complete
- What now?

# A Glimmer of Hope

 If given a candidate solution to a problem, we can <u>check if that solution is correct</u> <u>in polynomial-time</u>, then <u>maybe</u> a polynomial-time solution exists?

- Can we do this with Hamiltonian Circuit?
  - Given a candidate path, is it a Hamiltonian Circuit?

# The Complexity Class NP

 Definition: NP is the set of all problems for which a given candidate solution can be tested in polynomial time

- Examples of problems in NP:
  - Hamiltonian circuit: Given a candidate path, can test in linear time if it is a Hamiltonian circuit
  - Vertex Cover: Given a subset of vertices, do they cover all edges?
  - All problems that are in P (why?)

#### NP

Sorting
Shortest Path
Euler Circuit

Hamiltonian Circuit Satisfiability (SAT) Vertex Cover Travelling Salesman

# Why do we call it "NP"?

- NP stands for Nondeterministic Polynomial time
  - Why "nondeterministic"? Corresponds to algorithms that can guess a solution (if it exists), the solution is then verified to be correct in polynomial time
  - Can also think of as allowing a special operation that allows the algorithm to magically guess the right choice at each branch point.
  - Nondeterministic algorithms don't exist purely theoretical idea invented to understand how hard a problem could be

### Your Chance to Win a Turing Award!

It is generally believed that  $P \neq NP$ , *i.e.* there are problems in NP that are **not** in P

- But no one has been able to show even one such problem!
- This is the fundamental open problem in theoretical computer science
- Nearly everyone has given up trying to prove it.
   Instead, theoreticians prove theorems about what follows once we assume P ≠ NP!

# **NP-completeness**

- Set of problems in NP that (we are pretty sure)
   cannot be solved in polynomial time.
- These are thought of as the hardest problems in the class NP.
- Interesting fact: If any one NP-complete
  problem could be solved in polynomial time,
  then all NP-complete problems could be solved
  in polynomial time.
- Also: If any NP-complete problem is in P, then all of NP is in P

#### NP

Shortest Path
Euler Circuit

#### NP-Complete

Hamiltonian Circuit Satisfiability (SAT) Vertex Cover Travelling Salesman

# Saving Your Job

- Try as you might, every solution you come up with for the Hamiltonian Circuit problem runs in exponential time.....
- You have to report back to your boss.
- Your options:
  - Keep working
  - Come up with an alternative plan...

# In general, what to do with a Hard Problem

- Your problem seems really hard.
- If you can transform a known NP-complete problem into the one you're trying to solve, then you can stop working on your problem!

#### Your Third Task

- Your boss buys your story that others couldn't solve the last problem.
- Again, your company has to send someone by car to a set of cities. There is a road between every pair of cities.
- The primary cost is distance traveled (which translates to fuel costs).
- Your boss wants you to figure out <u>how to drive to</u> <u>each city exactly once</u>, then return to the first city, while <u>staying within a fixed mileage budget k</u>.

## Travelling Salesman Problem (TSP)

- Your third task is basically TSP:
  - Given complete weighted graph G, integer k.
  - Is there a cycle that visits all vertices with cost <= k?</p>
- One of the canonical problems.
- Note difference from Hamiltonian cycle:
  - graph is complete
  - we care about weight.

#### Transforming Hamiltonian Cycle to TSP

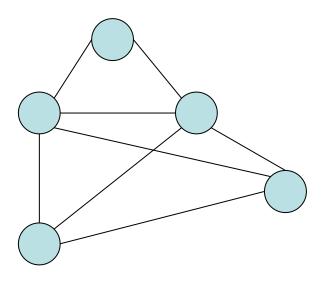

- We can "reduce" Hamiltonian Cycle to TSP.
- Given graph G=(V, E):
  - Assign weight of 1 to each edge
  - Augment the graph with edges until it is a complete graph G'=(V, E')
  - Assign weights of 2 to the new edges
  - Let k = |V|.

#### Notes:

- The transformation must take polynomial time
- You reduce the known NP-complete problem into your problem (not the other way around)

<sub>6/02/2023</sub>In this case we are assuming Hamiltonian Cycle is our known NP-complete problem (in reality, both are known NP-complete)

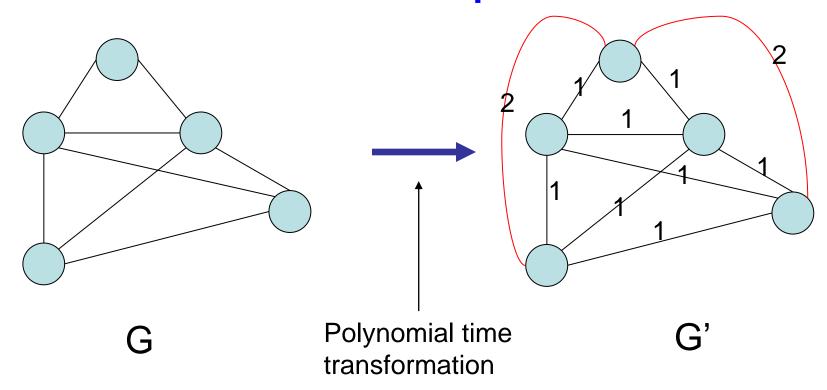

# Example

G

Input to Hamiltonian Circuit Problem

# Example

Input to Hamiltonian Circuit Problem

Input to Traveling Salesman Problem

# Polynomial-time transformation

- G' has a TSP tour of weight |V| iff
   G has a Hamiltonian Cycle.
- What was the cost of transforming HC into TSP?

 In the end, because there is a polynomial time transformation from HC to TSP, we say TSP is "at least as hard as" Hamiltonian cycle.

6/02/2023

#### What do we do about it?

#### Approximation Algorithm:

 Can we get an efficient algorithm that guarantees something *close* to optimal? (e.g. Answer is guaranteed to be within 1.5x of Optimal, but solved in polynomial time).

#### Restrictions:

 Many hard problems are easy for restricted inputs (e.g. graph is always a tree, degree of vertices is always 3 or less).

#### Heuristics:

Can we get something that seems to work well (good approximation/fast enough) most of the time? (e.g. In 6/02/2023 practice, n is small-ish)
