

Section 9: Concurrency & Graphs Solutions

0. User Profile

You are designing a new social-networking site to take over the world. To handle all the volume you expect, you want to support multiple threads with a fine-grained locking strategy in which each user's profile is protected with a different lock. At the core of your system is this simple class definition:

```
1  class UserProfile {
2      static int id_counter;
3      int id; // unique for each account
4      int[] friends = new int[9999]; // horrible style
5      int numFriends;
6      Image[] embarrassingPhotos = new Image[9999];
7
8      UserProfile() { // constructor for new profiles
9          id = id_counter++;
10         numFriends = 0;
11     }
12
13     synchronized void makeFriends(UserProfile newFriend) {
14         synchronized(newFriend) {
15             if(numFriends == friends.length
16                || newFriend.numFriends == newFriend.friends.length)
17                 throw new TooManyFriendsException();
18             friends[numFriends++] = newFriend.id;
19             newFriend.friends[newFriend.numFriends++] = id;
20         }
21     }
22
23     synchronized void removeFriend(UserProfile frenemy) {
24         ...
25     }
26 }
```

- a) The constructor has a concurrency error. What is it and how would you fix it? A short English answer is enough - no code or details required.

There is a data race on `id_counter`. Two accounts could get the same `id` if they are created simultaneously by different threads. Or even stranger things could happen. You could synchronize on a lock for `id_counter`.

- b) The `makeFriends` method has a concurrency error. What is it and how would you fix it? A short English answer is enough - no code or details required.

There is a potential deadlock if there are two objects `obj1` and `obj2` and one thread calls `obj1.makeFriends(obj2)` when another thread calls `obj2.makeFriends(obj1)`. The fix is to acquire locks in a consistent order based on the `id` fields, which are unique.

1. Bubble Tea

The `BubbleTea` class manages a bubble tea order assembled by multiple workers. Multiple threads could be accessing the same `BubbleTea` object. Assume the `Stack` objects are thread-safe, have enough space, and operations on them will not throw an exception.

```
1 public class BubbleTea {
2     private Stack<String> drink = new Stack<String>();
3     private Stack<String> toppings = new Stack<String>();
4     private final int maxDrinkAmount = 8;
5
6     // Checks if drink has capacity
7     public boolean hasCapacity() {
8         return drink.size() < maxDrinkAmount;
9     }
10
11    // Adds liquid to drink
12    public void addLiquid(String liquid) {
13        if (hasCapacity()) {
14            if (liquid.equals("Milk")) {
15                while (hasCapacity()) {
16                    drink.push("Milk");
17                }
18            } else {
19                drink.push(liquid);
20            }
21        }
22    }
23
24    // Adds newTop to list of toppings to add to drink
25    public void addTopping(String newTop) {
26        if (newTop.equals("Boba") || newTop.equals("Tapioca")) {
27            toppings.push("Bubbles");
28        } else {
29            toppings.push(newTop);
30        }
31    }
32 }
```

2. Phone Monitor

The `PhoneMonitor` class tries to help manage how much you use your cell phone each day. Multiple threads can access the same `PhoneMonitor` object. Remember that `synchronized` gives you reentrancy.

```
1 public class PhoneMonitor {
2     private int numMinutes = 0;
3     private int numAccesses = 0;
4     private int maxMinutes = 200;
5     private int maxAccesses = 10;
6     private boolean phoneOn = true;
7     private Object accessesLock = new Object();
8     private Object minutesLock = new Object();
9
10    public void accessPhone(int minutes) {
11        if (phoneOn) {
12            synchronized (accessesLock) {
13                synchronized (minutesLock) {
14                    numAccesses++;
15                    numMinutes += minutes;
16                    checkLimits();
17                }
18            }
19        }
20    }
21
22    private void checkLimits() {
23        synchronized (minutesLock) {
24            synchronized (accessesLock) {
25                if (numAccesses >= maxAccesses
26                    || numMinutes >= maxMinutes) {
27                    phoneOn = false;
28                }
29            }
30        }
31    }
32 }
```

3. It Rhymes with Flopological Sort

Consider the following graph:

- a) Does this graph have a topological sort? Explain why or why not. If you answered that it does not, remove the **MINIMUM** number of edges from the graph necessary for there to be a topological sort and carefully mark the edge(s) you are removing. Otherwise, just move on to the next part.

Yes, it does. This is a DAG (i.e., it has no cycles).

For the remaining parts, work with this (potentially) new version of the graph.

- b) Find a topological sort of the graph. Do not bother showing intermediary work.

There are many. One example is e, f, g, h, i, k, a, b, c, d, j

4. LMNST!

Consider the following graph:

- a) Find an MST of this graph using both of the two algorithms we've discussed in lecture. Make sure you say which algorithm you're using and show your work.

Using Prim's algorithm:

Vertex	Known	Cost of Edge
a	True	0
b	True	∞ 1
c	True	∞ 2
d	True	∞ 3
e	True	∞ 10
f	True	∞ 14 4
g	True	∞ 12 5
h	True	∞ 13 6
i	True	∞ 14
j	True	∞ 15 7
k	True	∞ 17 8
l	True	∞ 17 9

Using Kruskal's algorithm:

Starting Union Sets: {a}, {b}, {c}, {d}, {e}, {f}, {g}, {h}, {i}, {j}, {k}, {l}

Edge Being Processed	Resulting Union Find Forest
(a, b, 1)	{a, b}, {c}, {d}, {e}, {f}, {g}, {h}, {i}, {j}, {k}, {l}
(b, c, 2)	{a, b, c}, {d}, {e}, {f}, {g}, {h}, {i}, {j}, {k}, {l}
(c, d, 3)	{a, b, c, d}, {e}, {f}, {g}, {h}, {i}, {j}, {k}, {l}
(e, f, 4)	{a, b, c, d, e, f}, {g}, {h}, {i}, {j}, {k}, {l}
(f, g, 5)	{a, b, c, d, e, f, g}, {h}, {i}, {j}, {k}, {l}
(g, h, 6)	{a, b, c, d, e, f, g, h}, {i}, {j}, {k}, {l}
(i, j, 7)	{a, b, c, d, e, f, g, h}, {i, j}, {k}, {l}
(j, k, 8)	{a, b, c, d, e, f, g, h}, {i, j, k}, {l}
(k, l, 9)	{a, b, c, d, e, f, g, h}, {i, j, k, l}
(a, e, 10)	no change
(b, f, 11)	no change
(c, g, 12)	no change
(d, h, 13)	no change
(e, i, 14)	no change
(f, j, 15)	{a, b, c, d, e, f, g, h, i, j, k, l}

- b) Using just the graph, how can you determine if it's possible that there are multiple MSTs of the graph? Does this graph have multiple MSTs?

A graph can only have multiple MSTs if it has multiple edges of the same weight. This graph has two 17's, but neither of them are used in the MST. So, there's only one MST here.

- c) What is the asymptotic runtime of the algorithms that you used to compute the MSTs?

Prim's Algorithm takes $\mathcal{O}(|V| \lg(|V|) + |E| \lg(|V|))$, and Kruskal's Algorithm takes $\mathcal{O}(|E| \lg(|E|))$.
