

CSE 332 Autumn 2024

Lecture 10: AVL Trees 2

Nathan Brunelle

<http://www.cs.uw.edu/332>

Dictionary (Map) ADT

- Contents:

- Sets of key+value pairs
- Keys must be comparable

- Operations:

- insert(key, value)

- Adds the (key,value) pair into the dictionary
- If the key already has a value, overwrite the old value
 - Consequence: Keys cannot be repeated

- find(key)

- Returns the value associated with the given key

- delete(key)

- Remove the key (and its associated value)

Naïve attempts

Data Structure	Time to insert	Time to find	Time to delete
Unsorted Array	$\Theta(1)$	$\Theta(n)$	$\Theta(n)$
Unsorted Linked List	$\Theta(1)$	$\Theta(n)$	$\Theta(n)$
Sorted Array	$\Theta(n)$	$\Theta(\log n)$	$\Theta(n)$
Sorted Linked List	$\Theta(n)$	$\Theta(n)$	$\Theta(n)$
Heap	$\Theta(\log n)$	$\Theta(n)$	$\Theta(n)$
Binary Search Tree	$\Theta(n)$	$\Theta(n)$	$\Theta(n)$
AVL Tree	$\Theta(\log n)$	$\Theta(\log n)$	$\Theta(\log n)$

Binary Search Tree

- Binary Tree
 - Definition:
 - Tree where each node has at most 2 children
- Order Property
 - All keys in the left subtree are smaller than the root
 - All keys in the right subtree are larger than the root
 - Consequence: cannot have repeated values

Are these BSTs?

A

B

No

No

D

Aside: Why not use an array?

- We represented a heap using an array, finding children/parents by index
- We will represent BSTs with nodes and references. Why?
 - We might have “gaps” in our tree
 - Memory!

• 2^n

Find Operation (recursive)

```
find(key, root){  
  if (root == Null){  
    return Null;  
  }  
  if (key == root.key){  
    return root.value;  
  }  
  if (key < root.key){  
    return find(key, root.left);  
  }  
  if (key > root.key){  
    return find(key, root.right);  
  }  
  return Null;  
}
```

Find Operation (iterative)

```
find(key, root){  
    while (root != Null && key != root.key){  
        if (key < root.key){  
            root = root.left;  
        }  
        else if (key > root.key){  
            root = root.right;  
        }  
    }  
    if (root == Null){  
        return Null;  
    }  
    return root.value;  
}
```

Insert Operation (recursive)

```
insert(key, value, root){
    root = insertHelper(key, value, root);
}
insertHelper(key, value, root){
    if(root == null)
        return new Node(key, value);
    if (root.key < key)
        root.right = insertHelper(key, value, root.right);
    else
        root.left = insertHelper(key, value, root.left);
    return root;
}
```

Note: Insert happens only at the leaves!

Insert Operation (iterative)

```
insert(key, value, root){  
  if (root == Null){ this.root = new Node(key, value); }  
  parent = Null;  
  while (root != Null && key != root.key){  
    parent = root;  
    if (key < root.key){ root = root.left; }  
    else if (key > root.key){ root = root.right; }  
  }  
  if (root != Null){ root.value = value; }  
  else if (key < parent.key){ parent.left = new Node(key, value); }  
  else{ parent.right = new Node (key, value); }  
}
```

Note: Insert happens only at the leaves!

Delete Operation (iterative)

```
delete(key, root){  
  while (root != Null && key != root.key){  
    if (key < root.key){ root = root.left; }  
    else if (key > root.key){ root = root.right; }  
  }  
  if (root == Null){ return; }  
  // Now root is the node to delete, what happens next?  
}
```

Delete – 3 Cases

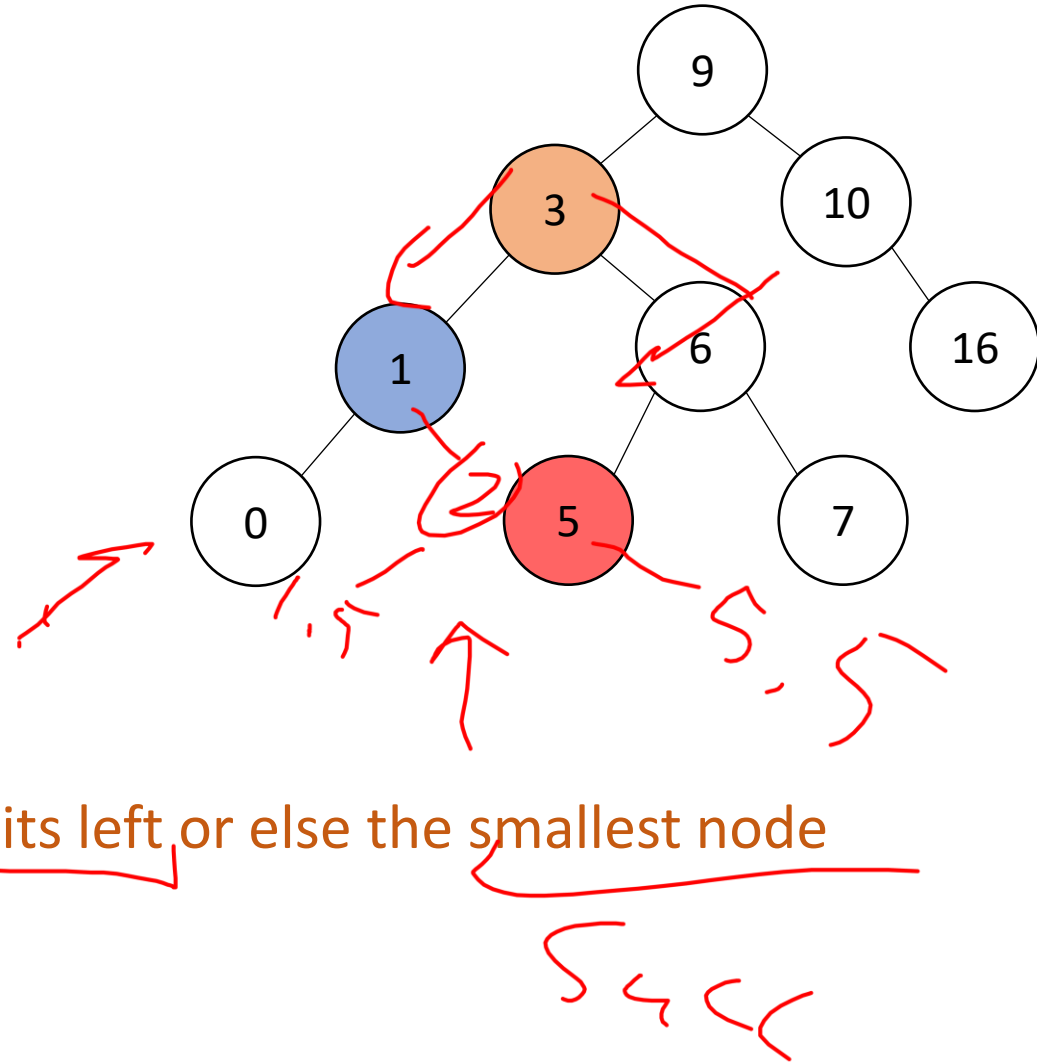

- 0 Children (i.e. it's a leaf)

- 1 Child

- Replace the deleted node with its child

- 2 Children

- Replace the deleted with the largest node to its left or else the smallest node to its right

Finding the Max and Min

- Max of a BST:
 - Right-most Thing
- Min of a BST:
 - Left-most Thing

```
maxNode(root){  
  if (root == Null){ return Null; }  
  while (root.right != Null){  
    root = root.right;  
  }  
  return root;  
}
```

```
minNode(root){  
  if (root == Null){ return Null; }  
  while (root.left != Null){  
    root = root.left;  
  }  
  return root;  
}
```

Delete Operation (iterative)

```
delete(key, root){
  while (root != Null && key != root.key){
    if (key < root.key){ root = root.left; }
    else if (key > root.key){ root = root.right; }
  }
  if (root == Null){ return; }
  if (root has no children){
    make parent point to Null Instead;
  }
  if (root has one child){
    make parent point to that child instead;
  }
  if (root has two children){
    make parent point to either the max from the left or min from the right
  }
}
```

Worst Case Analysis

- For each of ~~Find~~, ~~insert~~, ~~Delete~~:
 - Worst case running time matches height of the tree
- What is the maximum height of a BST with n nodes?
 - $\Theta(n)$

$$\frac{n}{2}$$

$$\log_2 n$$

Improving the worst case

- How can we get a better worst case running time?
 - Add rules about the shape of our BST
- AVL Tree
 - A BST with some shape rules
 - Algorithms need to change to accommodate those

“Balanced” Binary Search Trees

- We get better running times by having “shorter” trees
- Trees get tall due to them being “sparse” (many one-child nodes)
- Idea: modify how we insert/delete to keep the tree more “full”

Idea 1: Both Subtrees of Root have same #
Nodes

Idea 2: Both Subtrees of Root have same height

Idea 3: Both Subtrees of every Node have
same # Nodes

Idea 4: Both Subtrees of every Node have same height

AVL Tree

- A Binary Search tree that maintains that the left and right subtrees of every node have heights that differ by at most one.
 - height of left subtree and height of right subtree off by at most 1
 - Not too weak (ensures trees are short)
 - Not too strong (works for any number of nodes)
- Idea of AVL Tree:
 - When you insert/delete nodes, if tree is “out of balance” then modify the tree
 - Modification = “rotation”

Is it an AVL Tree?

Using AVL Trees

- Each node has:
 - Key
 - Value
 - Height
 - Left child
 - Right child

Inserting into an AVL Tree

- Starts out the same way as BST:
 - “Find” where the new node should go
 - Put it in the right place (it will be a leaf)
- Next check the balance
 - If the tree is still balanced, you’re done!
 - Otherwise we need to do rotations

Insert Example

10

Insert Example

Not Balanced!

Solution: rotate the whole tree to the right

Balanced!

Right Rotation

- Make the left child the new root
- Make the old root the right child of the new
- Make the new root's right subtree the old root's left subtree

Insert Example

20

Not Balanced!

Balanced!

Left Rotation

- Make the right child the new root
- Make the old root the left child of the new
- Make the new root's left subtree the old root's right subtree

Insertion Story So Far

- After insertion, update the heights of the node's ancestors
- Check for unbalance
- If unbalanced then at the deepest unbalanced root:
 - If the left subtree was deeper then rotate right
 - If the right subtree was deeper then rotate left

} This is incomplete!
There are some cases
where this doesn't work!

Insertion Story So Far

- After insertion, update the heights of the node's ancestors
- Check for unbalance
- If unbalanced then at the deepest unbalanced root:
 - Case LL: If we inserted in the **left** subtree of the **left** child then rotate right
 - Case RR: If we inserted in the **right** subtree of the **right** child then rotate left
 - Case LR: If we inserted into the **right** subtree of the **left** child then ???
 - Case RL: If we inserted into the **left** subtree of the **right** child then ???

Cases LR and RL require 2 rotations!

Case LR

- From deepest unbalanced root:
 - Rotate left at the left child
 - Rotate right at the root

Case LR in General

- Imbalance caused by inserting in the left child's right subtree
- Rotate left at the left child
- Rotate right at the unbalanced node

Case RL in General

- Imbalance caused by inserting in the right child's left subtree
- Rotate right at the right child
- Rotate left at the unbalanced node

Insert Summary

- After a BST insertion, update the heights of the node's ancestors
- From leaf to root, check if each node is unbalanced
- If a node is unbalanced then at the deepest unbalanced node:
 - Case LL: If we inserted in the **left** subtree of the **left** child then: rotate right
 - Case RR: If we inserted in the **right** subtree of the **right** child then: rotate left
 - Case LR: If we inserted into the **right** subtree of the **left** child then: rotate left at the left child and then rotate right at the root
 - Case RL: If we inserted into the **left** subtree of the **right** child then: rotate right at the right child and then rotate left at the root
- Done after either reaching the root or applying **one** of the above cases

Delete Summary

- Tldr: same cases, reverse direction of rotation, may need to repeat with ancestors
- After a BST deletion, update the heights of the node's ancestors
- From leaf to root, check if each node is unbalanced
- If a node is unbalanced then at the deepest unbalanced node:
 - Case LL: If we deleted in the **left** subtree of the **left** child then: **rotate left**
 - Case RR: If we deleted in the **right** subtree of the **right** child then: **rotate right**
 - Case LR: If we deleted into the **right** subtree of the **left** child then: **rotate right** at the left child and then **rotate left** at the root
 - Case RL: If we deleted into the **left** subtree of the **right** child then: **rotate left** at the right child and then **rotate right** at the root
- **Continue checking until reach the root**
