Self-Edges and Duplicate Edges

Some graphs may have duplicate edges (e.g. here we have the edge (1,2) twice). Some may also have self-edges (e.g. here there is an edge from 1 to 1). Graph with Neither self-edges nor duplicate edges are called simple graphs

Gore Habilication Popper de tions What are the nodes, what are the edges?

- Is the graph directed?
- Is the graph simple?
- Is the graph weighted?
- LinkedIn Connections
 - Nodes: People, edges: connection
 - Undirected: connections are mutual
 - Simple: yes, because I can't be connected to myself, no duplicate connection
 - Maybe:
- Twitter Followers
 - Nodes: accounts, following
 - Directed: following is not necessarily mutual
 - Simple: yes, because
- Java Inheritance
 - Nodes: classes, edges: extends, implements
 - Directed:
 - simple
- Airline Routes
 - Nodes: cities, Edges: a plane
 - Directed: maybe?
 - Probably not simple
- Course Prerequisites
 - Nodes: courses, edges prerequisite

Some Graph Terms

- Adjacent/Neighbors
 - Nodes are adjacent/neighbors if they share an edge

9

- Number of edges "touching" a vertex
- Indegree

Degree

- Number of incoming edges
- Outdegree
 - Number of outgoing edges

Definition: Complete Graph

V

A Graph G = (V, E) s.t. for any pair of nodes $v_1, v_2 \in V$ there is an edge from v_1 to v_2

Complete Undirected Graph

Complete Directed Graph

<u>Simple Path:</u> A path in which each node appears at most once <u>Cycle:</u>

A path which starts and ends in the same place

Definition: (Strongly) Connected Graph A Graph G = (V, E) s.t. for any pair of nodes

 $v_1, v_2 \in V$ there is a path from v_1 to v_2

Definition: (Strongly) Connected Graph

A Graph G = (V, E) s.t. for any pair of nodes $v_1, v_2 \in V$ there is a path from v_1 to v_2

Not (strongly) Connected

Connected

Definition: Weakly Connected Graph

A Graph G = (V, E) s.t. for any pair of nodes $v_1, v_2 \in V$ there is a path from v_1 to v_2 ignoring direction of edges

Weakly Connected

Not Weakly Connected 13

Graph Density, Data Structures, Efficiency

- The maximum number of edges in a graph is $\Theta(|V|^2)$:
 - Undirected and simple: $\frac{|V|(|V|-1)}{2}$
 - Directed and simple: |V|(|V| 1)
 - Direct and non-simple (but no duplicates): $|V|^2$
- If the graph is connected, the minimum number of edges is |V| 1
- If $|E| \in \Theta(|V|^2)$ we say the graph is **dense**
- If $|E| \in \Theta(|V|)$ we say the graph is **sparse**
- Because |E| is not always near to $|V|^2$ we do not typically substitute $|V|^2$ for |E| in running times, but leave it as a separate variable
 - However, $\log(|E|) \in \Theta(\log(|V|))$

Definition: Tree

A Graph G = (V, E) is a tree if it is undirect, connected, and has no cycles (i.e. is acyclic). Often one node is identified as the "root"

A Rooted Tree
