

# CSE 332 Autumn 2024

## Lecture 27: Complexity and Tractability

Nathan Brunelle

<http://www.cs.uw.edu/332>

# Running Times

Running times we've seen:

- $\Theta(1)$
- $\Theta(\log n)$
- $\Theta(n)$
- $\Theta(n \log n)$
- $\Theta(n^2)$
- $\Theta(2^n)$

# Running Times

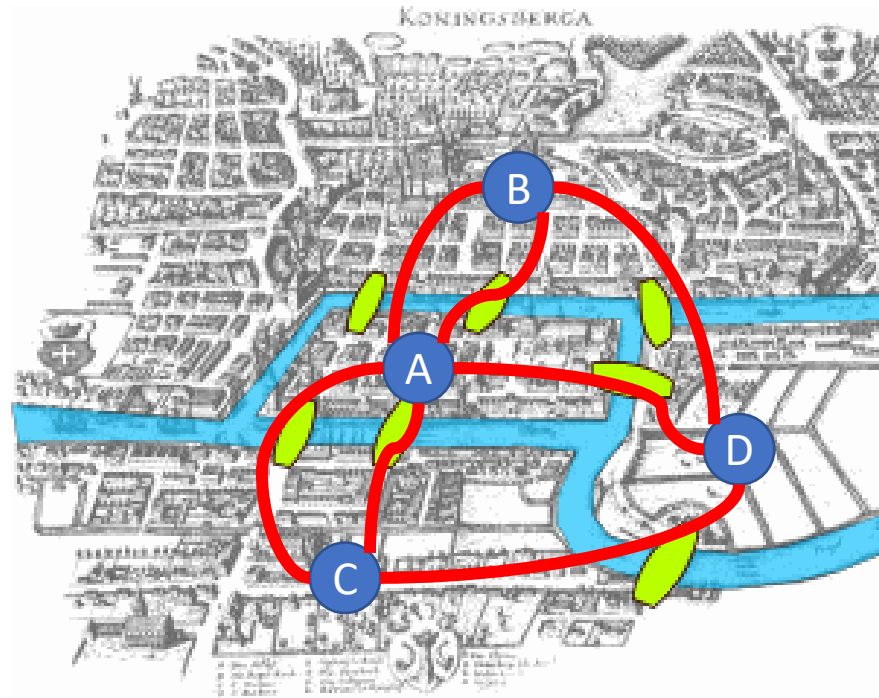

**Table 2.1** The running times (rounded up) of different algorithms on inputs of increasing size, for a processor performing a million high-level instructions per second. In cases where the running time exceeds  $10^{25}$  years, we simply record the algorithm as taking a very long time.

	$n$	$n \log_2 n$	$n^2$	$n^3$	$1.5^n$	$2^n$	$n!$
$n = 10$	< 1 sec	< 1 sec	< 1 sec	< 1 sec	< 1 sec	< 1 sec	4 sec
$n = 30$	< 1 sec	< 1 sec	< 1 sec	< 1 sec	< 1 sec	18 min	$10^{25}$ years
$n = 50$	< 1 sec	< 1 sec	< 1 sec	< 1 sec	11 min	36 years	very long
$n = 100$	< 1 sec	< 1 sec	< 1 sec	1 sec	12,892 years	$10^{17}$ years	very long
$n = 1,000$	< 1 sec	< 1 sec	1 sec	18 min	very long	very long	very long
$n = 10,000$	< 1 sec	< 1 sec	2 min	12 days	very long	very long	very long
$n = 100,000$	< 1 sec	2 sec	3 hours	32 years	very long	very long	very long
$n = 1,000,000$	1 sec	20 sec	12 days	31,710 years	very long	very long	very long

# Tractability

- Tractable:
  - Feasible to solve in the “real world”
- Intractable:
  - Infeasible to solve in the “real world”
- Whether a problem is considered “tractable” or “intractable” depends on the use case
  - For machine learning, big data, etc. tractable might mean  $O(n)$  or even  $O(\log n)$
  - For most applications it’s more like  $O(n^3)$  or  $O(n^2)$
- A strange pattern:
  - Most “natural” problems are either done in small-degree polynomial (e.g.  $n^2$ ) or else exponential time (e.g.  $2^n$ )
  - It’s rare to have problems which require a running time of  $n^5$ , for example

# 7 Bridges of Königsberg

The Pregel River runs through the city of Koenigsberg, creating 2 islands. Among these 2 islands and the 2 sides of the river, there are 7 bridges. Is there any path starting at one landmass which crosses each bridge exactly once?

# Euler Path Problem

- Path:

- A sequence of nodes  $v_1, v_2, \dots$  such that for every consecutive pair are connected by an edge (i.e.  $(v_i, v_{i+1})$  is an edge for each  $i$  in the path)

- Euler Path:

- A path such that every edge in the graph appears exactly once
  - If the graph is not simple then some pairs need to appear multiple times!

- Euler path problem:

- Given an undirected graph  $G = (V, E)$ , does there exist an Euler path for  $G$ ?

# Examples

- Which of the graphs below have an Euler path?

No Euler path exists!

Euler path exists!

*A, B, D, A, C, D*

Euler path exists!

*A, B, C, D, A, C, B, D*

# Euler's Theorem

- A graph has an Euler Path if and only if it is connected and has exactly 0 or 2 nodes with odd degree.

# Algorithm for the Euler Path Problem

- Given an undirected graph  $G = (V, E)$ , does there exist an Euler path for  $G$ ?
- Algorithm:
  - Check if the graph is connected
  - Check the degree of each node
  - If the number of nodes with odd degree is 0 or 2, return true
  - Otherwise return false
- Running time?

# A Seemingly Similar Problem

- Hamiltonian Path:
  - A path that includes every node in the graph exactly once
- Hamiltonian Path Problem:
  - Given a graph  $G = (V, E)$ , does that graph have a Hamiltonian Path?

True!  
*A, B, C, E, G, H, F, D*

# Algorithms for the Hamiltonian Path Problem

- Option 1:
  - Explore all possible simple paths through the graph
  - Check to see if any of those are length  $V$
- Option 2:
  - Write down every sequence of nodes
  - Check to see if any of those are a path
- Both options are examples of an **Exhaustive Search (“Brute Force”) algorithm**

# Option 2: List all sequences, look for a path

- Running time:
  - $G = (V, E)$
  - Number of permutations of  $V$  is  $|V|!$ 
    - $n! = n \cdot (n - 1) \cdot (n - 2) \cdot \dots \cdot 2 \cdot 1$
  - How does  $n!$  compare with  $2^n$ ?
    - $n! \in \Omega(2^n)$
  - Exponential running time!

# Option 1: Explore all simple paths, check for one of length $V$

- Running time:
  - $G = (V, E)$
  - Number of paths
    - Pick a first node ( $|V|$  choices)
    - Pick a neighbor (up to  $|V| - 1$  choices)
    - Pick a neighbor (up to  $|V| - 2$  choices)
    - .... Repeat  $|V| - 1$  total times
    - Overall:  $|V|!$  paths
  - Exponential running time

# Complexity Classes

- A Complexity Class is a set of problems (e.g. sorting, Euler path, Hamiltonian path)
  - The problems included in a complexity class are those whose most efficient algorithm has a specific upper bound on its running time (or memory use, or...)
- Examples:
  - The set of all problems that can be solved by an algorithm with running time  $O(n)$ 
    - Contains: Finding the minimum of a list, finding the maximum of a list, buildheap, summing a list, etc.
  - The set of all problems that can be solved by an algorithm with running time  $O(n^2)$ 
    - Contains: everything above as well as sorting, Euler path
  - The set of all problems that can be solved by an algorithm with running time  $O(n!)$ 
    - Contains: everything we've seen in this class so far

# Complexity Classes and Tractability

- To explore what problems are and are not tractable, we give some complexity classes special names:
- Complexity Class  $P$ :
  - Stands for “Polynomial”
  - The set of problems which have an algorithm whose running time is  $O(n^p)$  for some choice of  $p \in \mathbb{R}$ .
  - We say all problems belonging to  $P$  are “Tractable”
- Complexity Class  $EXP$ :
  - Stands for “Exponential”
  - The set of problems which have an algorithm whose running time is  $O(2^{n^p})$  for some choice of  $p \in \mathbb{R}$
  - We say all problems belonging to  $EXP - P$  are “Intractable”
    - Disclaimer: Really it’s all problems outside of  $P$ , and there are problems which do not belong to  $EXP$ , but we’re not going to worry about those in this class

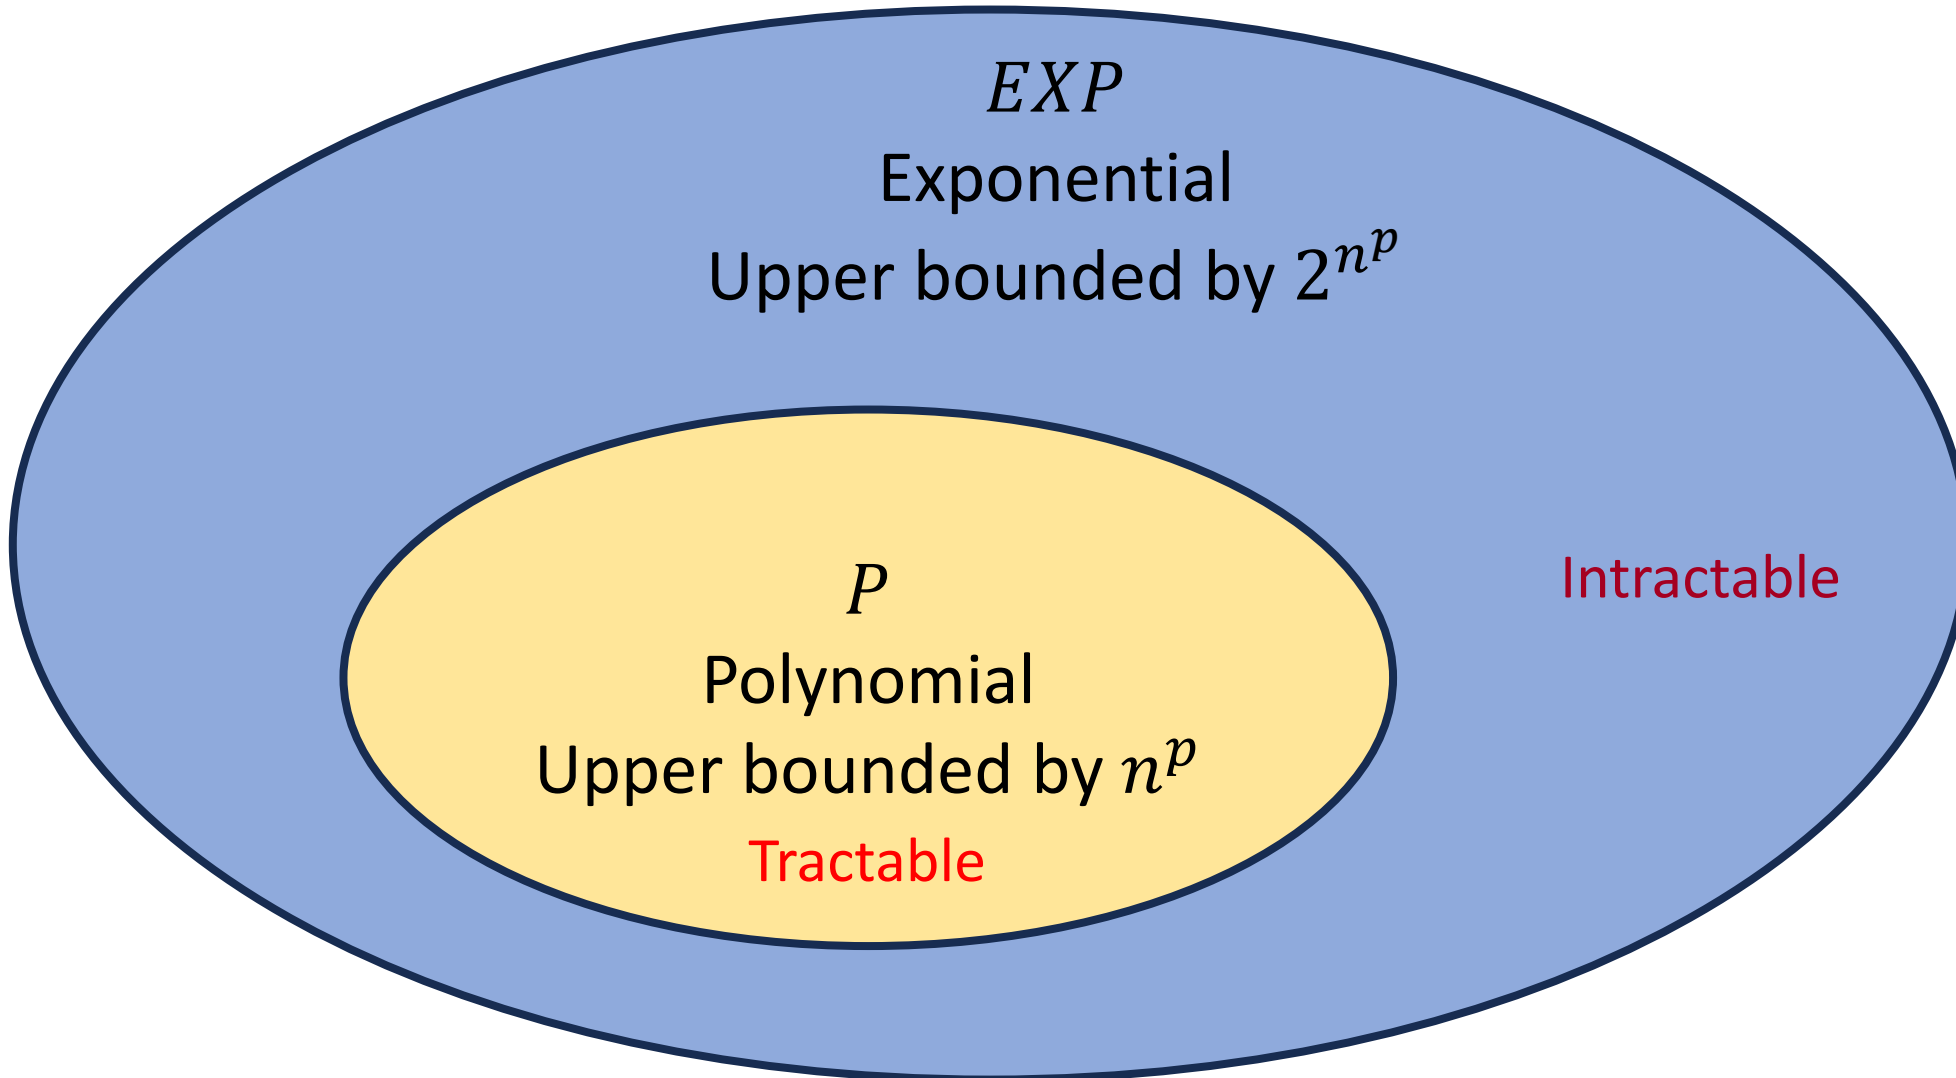

# $EXP$ and $P$

**Important!**

$$P \subset EXP$$

Every problem within  $P$  is also within  $EXP$

The intractable ones are the problems within  $EXP$  but NOT  $P$

# Members

## Important!

Some of the problems we've listed in *EXP* could also be members of *P*. Since membership is determined by a problem's *most* efficient algorithm, knowing if a problem belongs to *P* requires knowing the best algorithm possible!

# Studying Complexity and Tractability

- Organizing problems into complexity classes helps us to reason more carefully and flexibly about tractability
- The goal for each problem is to either
  - Find an efficient algorithm if it exists
    - i.e. show it belongs to  $P$
  - Prove that no efficient algorithm exists
    - i.e. show it does not belong to  $P$
- Complexity classes allow us to reason about sets of problems at a time, rather than each problem individually
  - If we can find more precise classes to organize problems into, we might be able to draw conclusions about the entire class
  - It may be easier to show a problem belongs to class  $C$  than to  $P$ , so it may help to show that  $C \subseteq P$

# Some problems in *EXP* seem “easier”

- There are some problems that we do not have polynomial time algorithms to solve, but provided answers are easy to check
- Hamiltonian Path:
  - It’s “hard” to look at a graph and determine whether it has a Hamiltonian Path
  - It’s “easy” to look at a graph and a candidate path together and determine whether THAT path is a Hamiltonian Path
    - It’s easy to **verify** whether a given path is a Hamiltonian path

# Class $NP$

- $NP$ 
  - The set of problems for which a candidate solution can be verified in polynomial time
  - Stands for “Non-deterministic Polynomial”
    - Corresponds to algorithms that can guess a solution (if it exists), that solution is then verified to be correct in polynomial time
    - Can also think of as allowing a special operation that allows the algorithm to magically guess the right choice at each step of an exhaustive search
- $P \subseteq NP$ 
  - Why?

$$EXP \supset NP \supseteq P$$

# Solving and Verifying Hamiltonian Path

- Give an algorithm to solve Hamiltonian Path
  - Input:  $G = (V, E)$
  - Output: True if  $G$  has a Hamiltonian Path
  - Algorithm: Check whether each permutation of  $V$  is a path.
    - Running time:  $|V|!$ , so does not show whether it belongs to  $P$
- Give an algorithm to verify Hamiltonian Path
  - Input:  $G = (V, E)$  and a sequence of nodes
  - Output: True if that sequence of nodes is a Hamiltonian Path
  - Algorithm:
    - Check that each node appears in the sequence exactly once
    - Check that the sequence is a path
    - Running time:  $O(V \cdot E)$ , so it belongs to  $NP$

# Party Problem

Draw Edges between people who don't get along  
How many people can I invite to a party if everyone must get along?

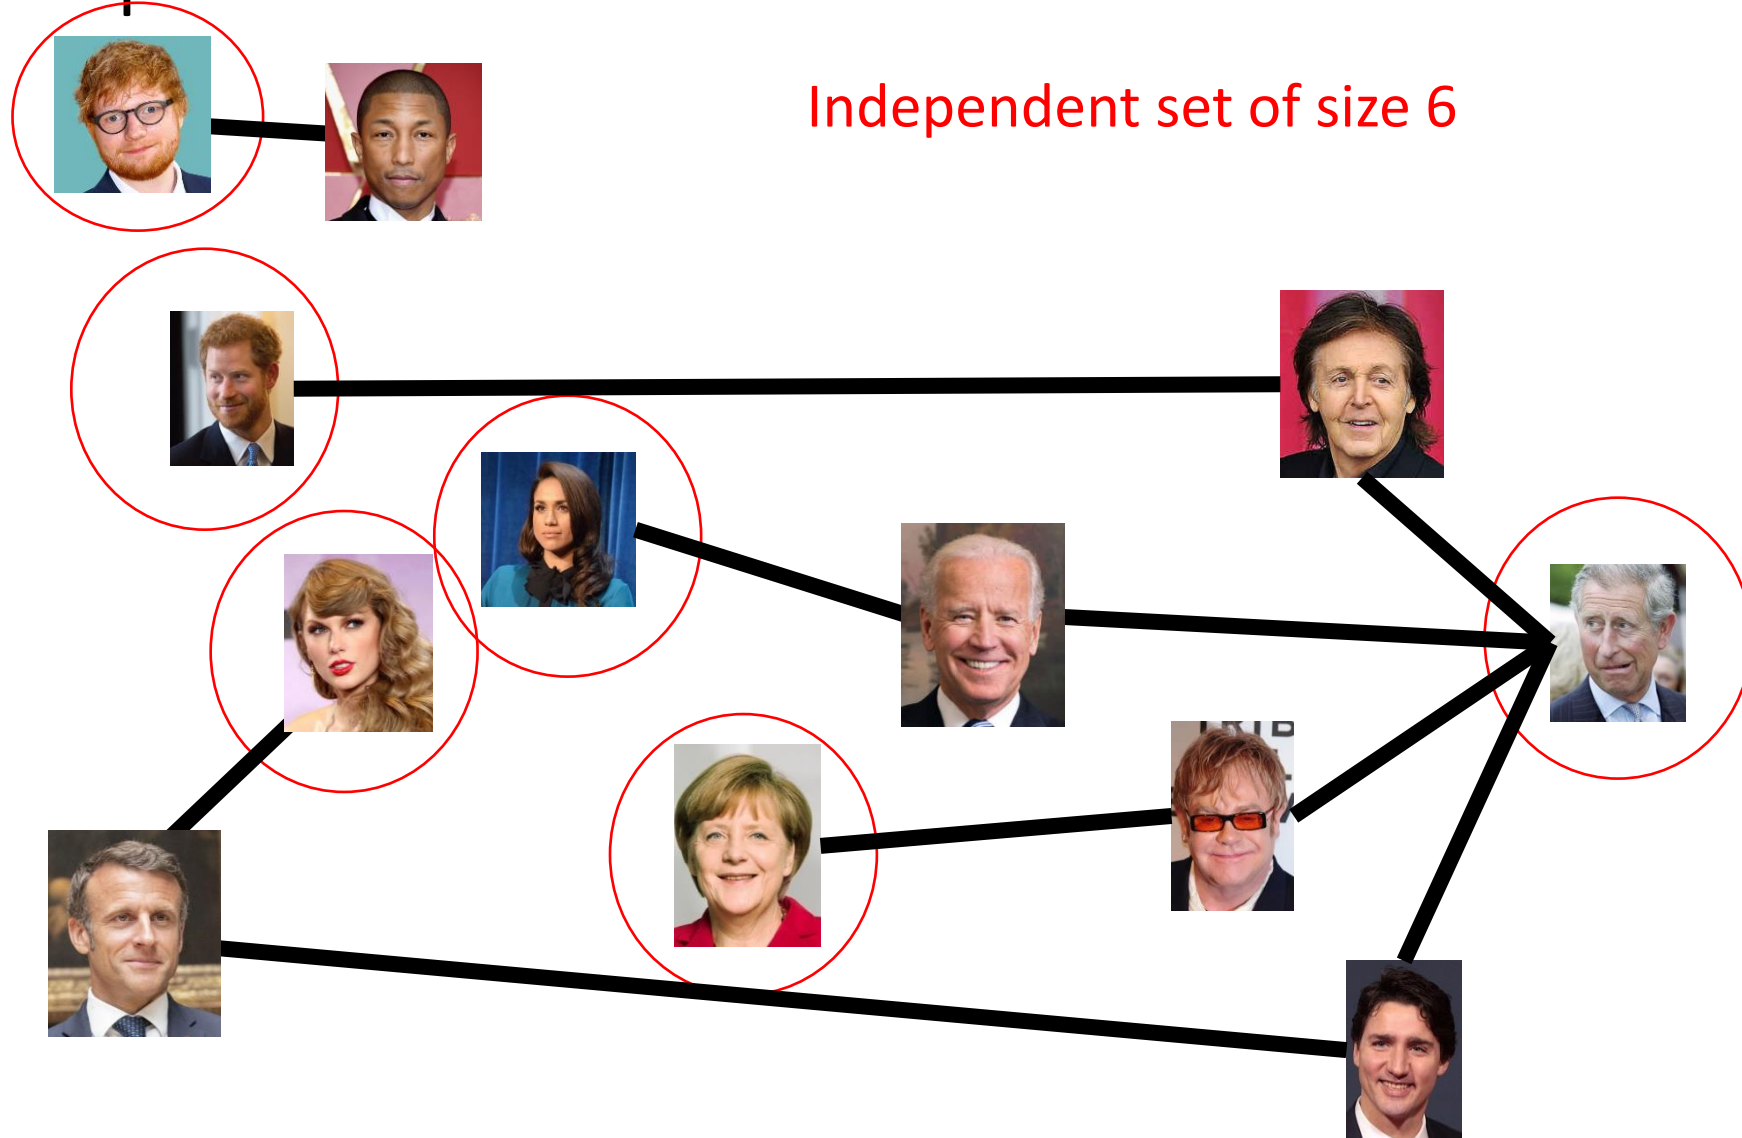

# Independent Set

- Independent set:
  - $S \subseteq V$  is an independent set if no two nodes in  $S$  share an edge
- Independent Set Problem:
  - Given a graph  $G = (V, E)$  and a number  $k$ , determine whether there is an independent set  $S$  of size  $k$

# Example

# Solving and Verifying Independent Set

- Give an algorithm to **solve** independent set
  - Input:  $G = (V, E)$  and a number  $k$
  - Output: True if  $G$  has an independent set of size  $k$
- Give an algorithm to **verify** independent set
  - Input:  $G = (V, E)$ , a number  $k$ , and a set  $S \subseteq V$
  - Output: True if  $S$  is an independent set of size  $k$

# Generalized Baseball

# Generalized Baseball

Need to place defenders on bases such that every edge is defended

How many defenders would suffice?

# Vertex Cover

- Vertex Cover:
  - $C \subseteq V$  is a vertex cover if every edge in  $E$  has one of its endpoints in  $C$
- Vertex Cover Problem:
  - Given a graph  $G = (V, E)$  and a number  $k$ , determine if there is a vertex cover  $C$  of size  $k$

# Example

# Solving and Verifying Vertex Cover

- Give an algorithm to **solve** vertex cover
  - Input:  $G = (V, E)$  and a number  $k$
  - Output: True if  $G$  has a vertex cover of size  $k$
- Give an algorithm to **verify** vertex cover
  - Input:  $G = (V, E)$ , a number  $k$ , and a set  $S \subseteq E$
  - Output: True if  $S$  is a vertex cover of size  $k$
