

CSE 332 Autumn 2024

Lecture 5: Recurrences

Nathan Brunelle

<http://www.cs.uw.edu/332>

Recursive Binary Search

5	8	13	42	75	79	88	90	95	99
0	1	2	3	4	5	6	7	8	9

```
public static boolean binarySearch(List<Integer> lst, int k){  
    return binarySearch(lst, k, 0, lst.size());  
}
```

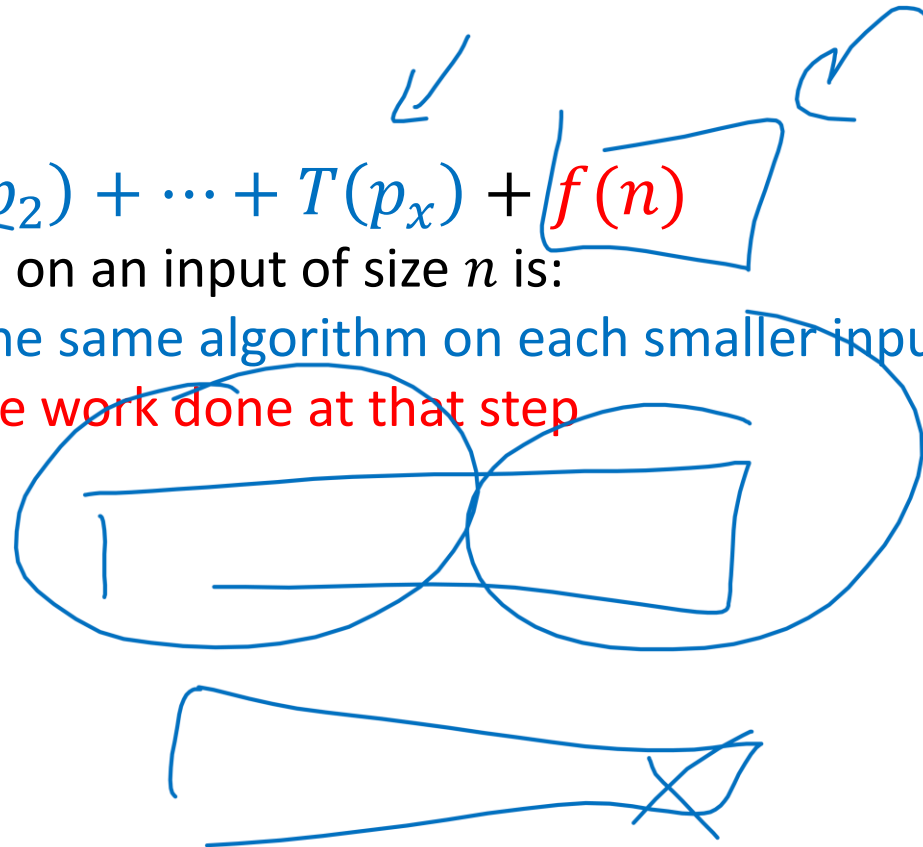

```
private static boolean binarySearch(List<Integer> lst, int k, int start, int end){  
    if(start == end) |  
        return false;  
    int mid = start + (end-start)/2; ✓  
    if(lst.get(mid) == k) |  
        return true;  
    } else if(lst.get(mid) > k) |  
        return binarySearch(lst, k, start, mid);  
    } else  
        return binarySearch(lst, k, mid+1, end);  
    }  
}
```

$$T(n) = 3 + T\left(\frac{n}{2}\right)$$

Handwritten red annotations: a large curly brace on the left side of the equation, a squiggly line above the constant 3, and an upward-pointing arrow below the fraction $\frac{n}{2}$.

Analysis of Recursive Algorithms

- Overall structure of recursion:
 - Do some non-recursive “work”
 - Do one or more recursive calls on some portion of your input
 - Do some more non-recursive “work”
 - Repeat until you reach a base case
- Running time: $T(n) = T(p_1) + T(p_2) + \dots + T(p_x) + f(n)$
 - The time it takes to run the algorithm on an input of size n is:
 - The sum of how long it takes to run the same algorithm on each smaller input
 - Plus the total amount of non-recursive work done at that step
- Usually:
 - $T(n) = a \cdot T\left(\frac{n}{b}\right) + f(n)$
 - Called “divide and conquer”
 - $T(n) = T(n - c) + f(n)$
 - Called “chip and conquer”

How Efficient Is It?

- $T(n) = 1 + T\left(\left\lfloor \frac{n}{2} \right\rfloor\right)$
- Base case: $T(1) = 1$

$T(n)$ = “cost” of running the entire algorithm on an array of length n

Let's Solve the Recurrence!

$$T(1) = 1$$

$$T(n) = 1 + T(n/2)$$

$$1 + T(n/4)$$

$$1 + T(n/8)$$

...

1

$$2^x = 1$$
$$x = \log_2 n$$

Substitute until $T(1)$
So $\log_2 n$ steps

$$T(n) = \sum_{i=1}^{\log_2 n} 1 = \log_2 n$$

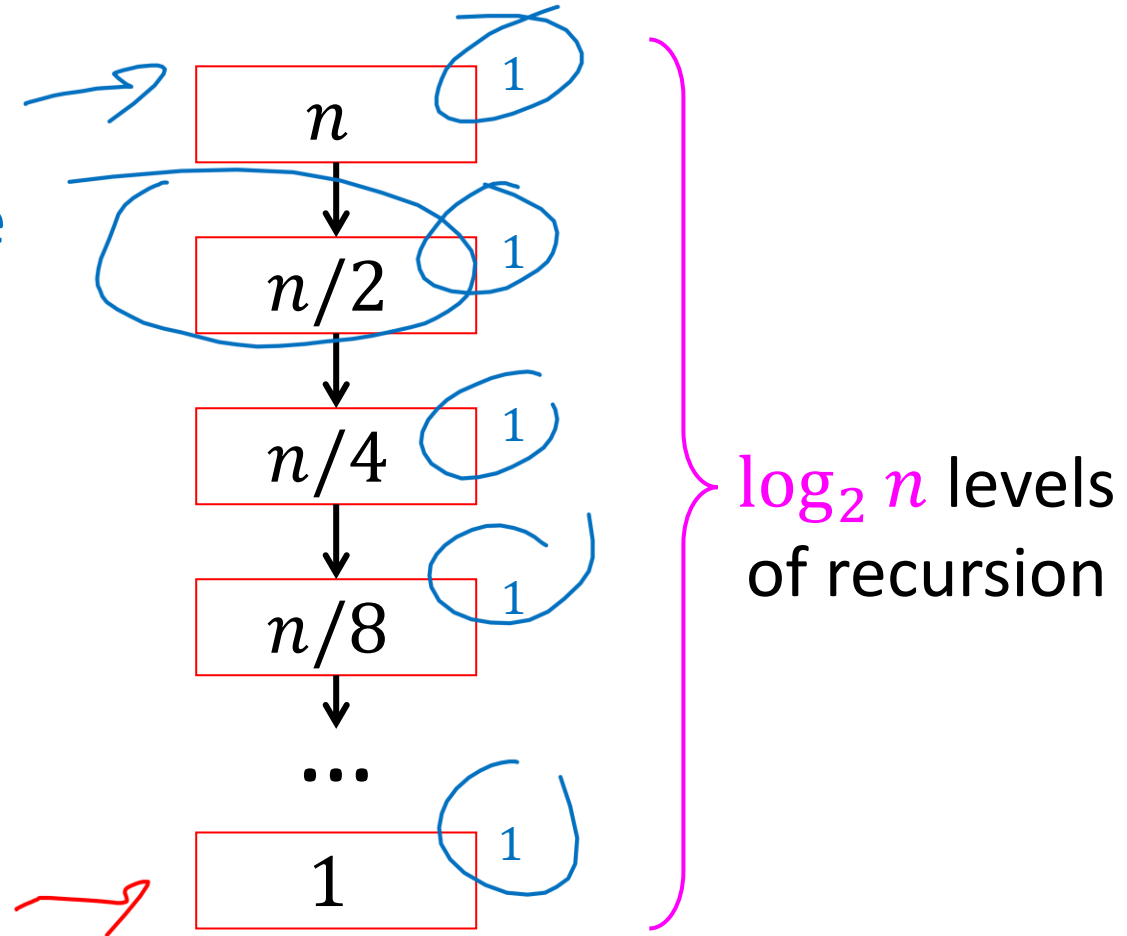

$$T(n) \in \Theta(\log n)$$

Make our process “prettier”

$$T(n) = T\left(\frac{n}{2}\right) + 1$$

- Draw a picture of the recursion
- Identify the work done per stack frame
- Add up all the work!
 - Sum is the answer!
 - In this case $\Theta(\log_2 n)$

The “Tree Method”

Recursive Linear Search

5	8	13	42	75	79	88	90	95	99
0	1	2	3	4	5	6	7	8	9

```
public static boolean linearSearch(List<Integer> lst, int k){  
    return linearSearch(lst, k, 0, lst.size());  
}
```

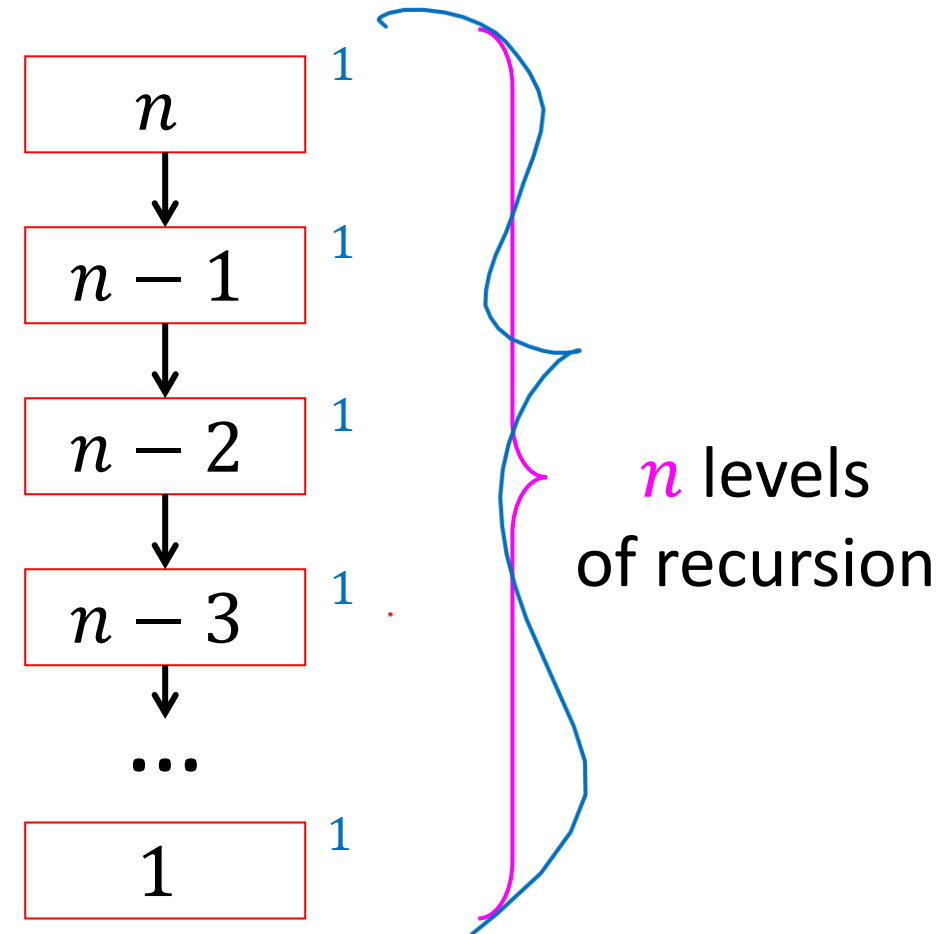

```
private static boolean linearSearch(List<Integer> lst, int k, int start, int end){  
    if(start == end){  
        return false;  
    } else if(lst.get(start) == k){  
        return true;  
    } else{  
        return linearSearch(lst, k, start+1, end);  
    }  
}
```

$$T(n) = T(n-1) + 1$$

Make our method “prettier”

$$T(n) = T(n - 1) + 1$$

- Draw a picture of the recursion
- Identify the work done per stack frame
- Add up all the work!

Running time: $\Theta(n)$

Recursive List Summation

```
public int sum(int[] list){  
    return sum_helper(list, 0, list.size);  
}
```

```
private int sum_helper(int[] list, int low, int high){  
    if (low == high){ return 0; }  
    if (low == high-1){ return list[low]; }  
    int middle = (high+low)/2;  
    return sum_helper(list, low, middle) + sum_helper(list, middle, high);  
}
```

$$T(n) = 2T\left(\frac{n}{2}\right) + 1$$

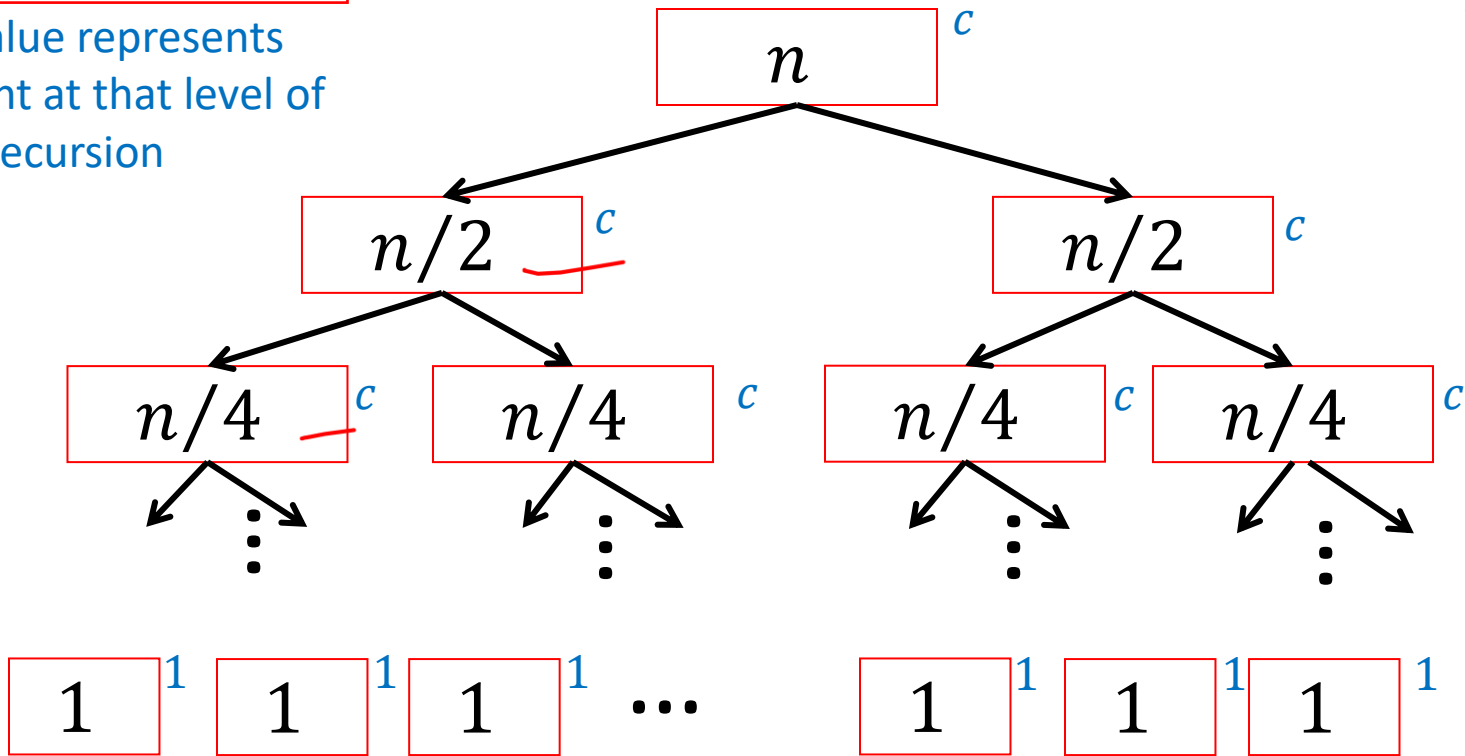

Tree Method

Red box represents a problem instance

Blue value represents time spent at that level of recursion

$$T(n) = 2T\left(\frac{n}{2}\right) + c$$

$\Rightarrow 2^i \cdot c$ work per level

$\log_2 n$ levels of recursion

$$T(n) = \sum_{i=1}^{\log_2 n} 2^i \cdot c$$

Recursive List Summation

$$T(n) = \sum_{i=1}^{\log_2 n} 2^i \cdot \underline{c}$$

$$= \underline{c} \cdot \sum_{i=1}^{\log_2 n} 2^i$$

$$= \underline{c} \left(\frac{1 - 2^{\log_2 n + 1}}{1 - 2} \right) \approx n$$

Let's do some more!

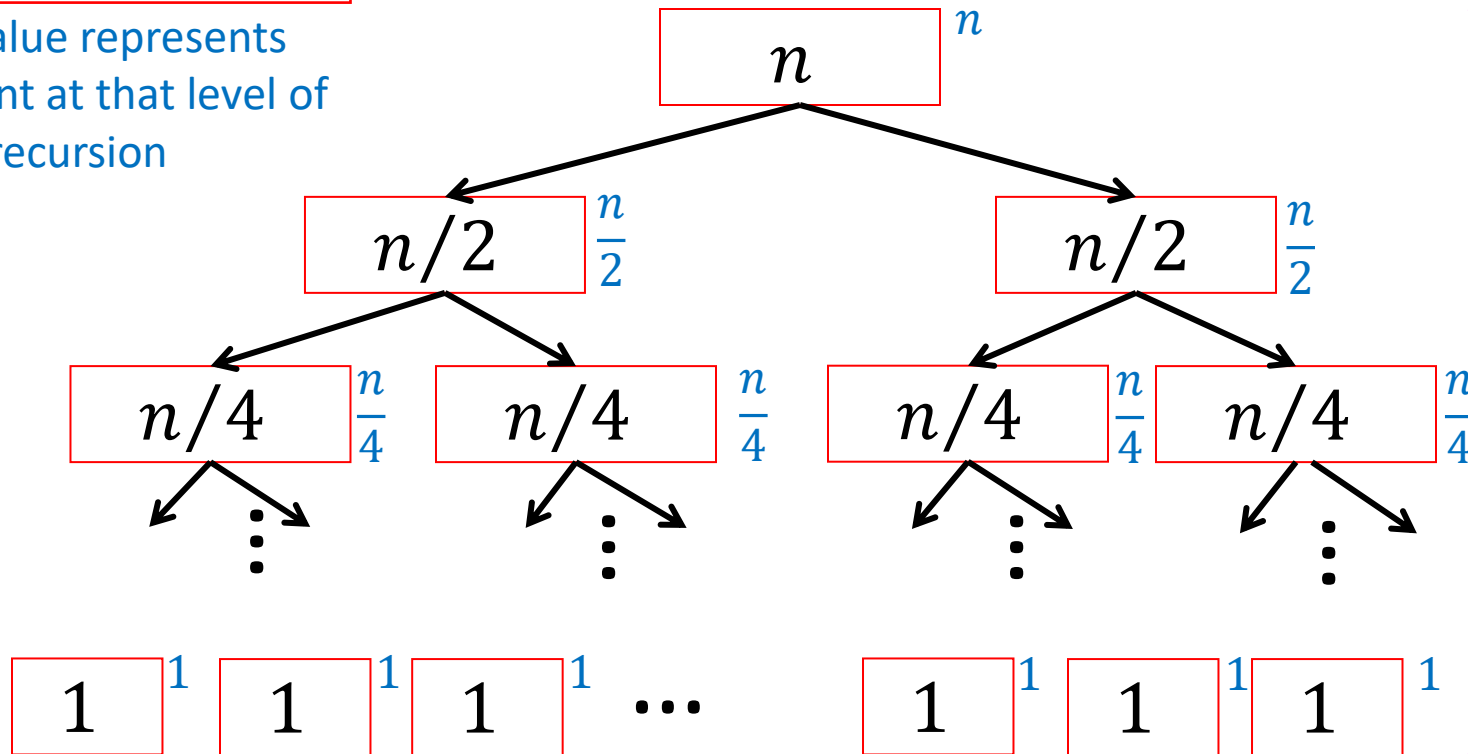

- For each, assume the base case is $n = 1$ and $T(1) = 1$
- $T(n) = 2T\left(\frac{n}{2}\right) + n$
- $T(n) = 2T\left(\frac{n}{2}\right) + n^2$
- $T(n) = 2T\left(\frac{n}{8}\right) + 1$

Tree Method

$$T(n) = 2T\left(\frac{n}{2}\right) + n$$

Red box represents a problem instance

Blue value represents time spent at that level of recursion

$\Rightarrow n$ work per level

$\log_2 n$ levels of recursion

$$T(n) = \sum_{i=1}^{\log_2 n} n$$

Tree Method

$$T(n) = 2T\left(\frac{n}{2}\right) + n^2$$

Red box represents a problem instance

Blue value represents time spent at that level of recursion

\Rightarrow ?? work per level

$\log_2 n$ levels of recursion

$$T(n) = \sum_{i=1}^{\log_2 n} ??$$

$$T(n) = \sum_{i=1}^{\log_2 n} \frac{n^2}{2^i}$$

$$= n^2 \cdot \sum_{i=1}^{\log_2 n} \left(\frac{1}{2}\right)^i$$

Tree Method

$$T(n) = 2T\left(\frac{n}{8}\right) + 1$$

Red box represents a problem instance

Blue value represents time spent at that level of recursion

$\Rightarrow 2^i$ work per level

$\log_8 n$ levels of recursion

$$T(n) = \sum_{i=1}^{\log_8 n} 2^i$$

$$T(n) = \sum_{i=1}^{\log_8 n} 2^i$$

$$= \left(\frac{1 - 2^{\log_8 n}}{1 - 2} \right)$$

$$= 2^{\log_8 n} - 1$$

$$= n^{\log_8 2} = n^{\frac{1}{3}}$$

$$\sum_{i=0}^L a^i$$

Finite Geometric Series

If $a > 1$

$$\sum_{i=0}^L a^i$$

Finite Geometric Series

If $a < 1$
