Exercise 1 Solutions

**Honor Code:** This document is exclusively for Summer 2024 CSE332 students with Professor Nathan Brunelle at The University of Washington - Seattle. Any student who references this document outside of that course during that quarter (including any student who retakes the course in a different quarter), or who shares this document with another student who is not in that course during that quarter, or who in any way makes copies of this document (digital or physical) without consent of Professor Nathan Brunelle is guilty of cheating, and therefore subject to penalty according to the University of Washington CSSC.
Question 5: Big-Oh Proofs

For a given $f(n)$ and $g(n)$ we must show that $f(n) \in O(g(n))$.

5.1 $f(n) = n^3, g(n) = n^3 - n$

Strategy: Select a value $c > 0$ and $n_0$ so that $\forall n > n_0$ we have that $n^3 \leq c \cdot (n^3 - n)$.

Proof: We select $c = 2$ and $n_0 = 3$. Next we demonstrate that the goal holds for this choice.

We will begin by applying algebra to rearrange the target inequality.

\[
\begin{align*}
    n^3 &\leq c \cdot (n^3 - n) \\
    n^3 &\leq cn^3 - cn \\
    n^2 &\leq cn^2 - c \\
    n^2 + c &\leq cn^2 \\
    c &\leq (c - 1)n^2 
\end{align*}
\]

This last statement is true for our choice of $c$ and $\forall n > n_0$ because $(2 - 1)3^2 = 9$, and also the right-hand-side is increasing whereas the left-hand side is constant. Therefore $f(n) \in O(g(n))$.

5.2 $f(n) = \log_2(n^4), g(n) = \log_2(n^{1/4})$

Strategy: Select a value $c > 0$ and $n_0$ so that $\forall n > n_0$ we have that $\log_2(n^4) \leq c\log_2(n^{1/4})$.

Proof: We select $c = 16$ and $n_0 = 1$. Next we demonstrate that the goal holds for this choice.

We will begin by applying algebra to rearrange the target inequality.

\[
\begin{align*}
    \log_2(n^4) &\leq c\log_2(n^{1/4}) \\
    4\log_2(n) &\leq \frac{c}{4}\log_2(n) 
\end{align*}
\]

This last statement is true for our choice of $c = 16$ and $\forall n > 1$ because $\frac{16}{4}\log_2(n) = 4\log_2(n)$. Therefore $f(n) \in O(g(n))$.

5.3 $f(n) = \log_2(n), g(n) = \log_{10}(n)$

Strategy: Select a value $c > 0$ and $n_0$ so that $\forall n > n_0$ we have that $\log_2(n) \leq c\log_{10}(n)$.

Proof: We select $c = \frac{1}{\log_{10}(2)}$ and $n_0 = 1$. Next we demonstrate that the goal holds for this choice.

We will begin by applying log rules to rearrange the target inequality.
\[\log_2(n) \leq c \log_{10}(n)\]
\[\log_2(n) \leq c \log_{10}(2^{\log_2(n)})\]
\[\log_2(n) \leq c \log_2(n) \log_{10}(2)\]

This last statement is true for our choice of \(c = \frac{1}{\log_{10}(2)}\) and \(\forall n > 1\) because \(\frac{1}{\log_{10}(2)} \log_2(n) \log_{10}(2) = \log_2(n)\). Therefore \(f(n) \in O(g(n))\).

**5.4** \(f(n) = n^{100}, g(n) = 2^n\)

Strategy: Select a value \(c > 0\) and \(n_0\) so that \(\forall n > n_0\) we have that \(n^{100} \leq c 2^n\).

Proof: We select \(c = 1\) and \(n_0 = 1000\). Next we demonstrate that the goal holds for this choice.

We will begin by applying taking the log of both sides of the inequality, and then performing log rules and algebra to simplify the expressions.

\[\log_2(n^{100}) \leq \log_2(2^n)\]
\[100 \log_2(n) \leq \log_2(2^n)\]
\[100 \log_2(n) \leq n\]

To summarize, we know now that \(n^{100} \leq c 2^n\) whenever \(100 \log_2(n) \leq n\). First, observe that this is true for \(n = 1000\) because \(\log_2(1000) < 10\). We will then show that \(100 \log_2(n) \leq n\) for all choices of \(n > 1000\) via induction. Assume \(100 \log_2(n) \leq n\) for some choice of \(n \geq n_0\), we will show that \(100 \log_2(n + 1) \leq n + 1\).

To begin, we will note that \(n + 1 \leq n \left(\frac{n_0 + 1}{n_0}\right)\). This is because \(n \left(\frac{n_0 + 1}{n_0}\right) = n \frac{n_0}{n_0} + \frac{n}{n_0}\) and \(\frac{n_0}{n_0} = 1\) and \(\frac{n}{n_0} \geq 1\). Therefore it’s sufficient to show \(100 \log_2(n \left(\frac{1001}{1000}\right)) \leq n + 1\). We next apply log rules to simplify:

\[100 \log_2(n) \left(\frac{1001}{1000}\right) \leq n + 1\]
\[100 \log_2(n) + 100 \log_2\left(\frac{1001}{1000}\right) \leq n + 1\]

By our inductive hypothesis \(100 \log_2(n) \leq n\), and by inspection \(100 \log_2\left(\frac{1001}{1000}\right) < 1\), meaning the inequality holds, proving the inductive step. We can therefore conclude \(100 \log_2(n) \leq n\) for all choice of \(n > 1000\) meaning \(f(n) \in O(g(n))\).
