Hash Tables

• Idea:
  • Have a small array to store information
  • Use a hash function to convert the key into an index
    • Hash function should “scatter” the keys, behave as if it randomly assigned keys to indices
  • Store key at the index given by the hash function
  • Do something if two keys map to the same place (should be very rare)
    • Collision resolution

Key Object

\[ h(k) \]

Index between 0 and size-1

Insert / find / delete

& value
Properties of a “Good” Hash

• Definition: A hash function maps objects to integers

• Should be very efficient
  • Calculating the hash should be negligible

• Should randomly scatter objects
  • Objects that are similar to each other should be likely to end up far away

• Should use the entire table
  • There should not be any indices in the table that nothing can hash to
  • Picking a table size that is prime helps with this

• Should use things needed to “identify” the object
  • Use only fields you would check for a .equals method be included in calculating the hash
  • More fields typically leads to fewer collisions, but less efficient calculation
A Bad Hash (and phone number trivia)

• $h(phone) =$ the first digit of the phone number
  • No US phone numbers start with 1 or 0
  • If we’re sampling from this class, 2 is by far the most likely
Compare These Hash Functions (for strings)

• Let $s = s_0s_1s_2 \ldots s_{m-1}$ be a string of length $m$
  • Let $a(s_i)$ be the ascii encoding of the character $s_i$
  • $h_1(s) = a(s_0)$
  • $h_2(s) = (\sum_{i=0}^{m-1} a(s_i))$ and damn prime
  • $h_3(s) = (\sum_{i=0}^{m-1} a(s_i) \cdot 37^i)$
Collision Resolution

- A Collision occurs when we want to insert something into an already-occupied position in the hash table.

- 2 main strategies:
  - Separate Chaining
    - Use a secondary data structure to contain the items
      - E.g. each index in the hash table is itself a linked list
  - Open Addressing
    - Use a different spot in the table instead
      - Linear Probing
      - Quadratic Probing
      - Double Hashing
Separate Chaining Insert

• To insert $k, v$:
  • Compute the index using $i = h(k) \% \text{size}$
  • Add the key-value pair to the data structure at $\text{table}[i]$
Separate Chaining Find

- To find $k$:
  - Compute the index using $i = h(k) \% \text{size}$
  - Call find with the key on the data structure at $table[i]$
Separate Chaining Delete

• To delete $k$:
  • Compute the index using $i = h(k) \% \text{size}$
  • Call delete with the key on the data structure at $table[i]$
Formal Running Time Analysis

- The load factor of a hash table represents the average number of items per “bucket”
  \[ \lambda = \frac{n}{\text{size}} \]

- Assume we have a hash table that uses a linked-list for separate chaining
  - What is the expected number of comparisons needed in an unsuccessful find?
  - What is the expected number of comparisons needed in a successful find?
  - How can we make the expected running time \( \Theta(1) \)?
Load Factor?

\[ \frac{3}{10} = 0.3 \]
Load Factor?

80%
Load Factor?
Collision Resolution: Linear Probing

- When there’s a collision, use the next open space in the table
Linear Probing: Insert Procedure

• To insert $k, v$
  • Calculate $i = h(k) \% \text{size}$
  • If $\text{table}[i]$ is occupied then try $(i + 1) \% \text{size}$
  • If that is occupied try $(i + 2) \% \text{size}$
  • If that is occupied try $(i + 3) \% \text{size}$
  • ...

\[ \begin{array}{cccccccccc}
0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 \\
\end{array} \]
Linear Probing: Find

- Let’s do this together!
Linear Probing: Find

• To find key $k$
  • Calculate $i = h(k) \mod size$
  • If $table[i]$ is occupied and does not contain $k$ then look at $(i + 1) \mod size$
  • If that is occupied and does not contain $k$ then look at $(i + 2) \mod size$
  • If that is occupied and does not contain $k$ then look at $(i + 3) \mod size$
  • Repeat until you either find $k$ or else you reach an empty cell in the table
Linear Probing: Delete

• Let’s do this together!
Linear Probing: Delete

• Option 1: Find the last thing with a matching hash, move that into the spot you deleted from

• Option 2: Called “tombstone” deletion. Leave a special object that indicates an object was deleted from there
  • The tombstone does not act as an open space when finding (so keep looking after its reached)
  • When inserting you can replace a tombstone with a new item

\[ h(\text{inserted}) = h(\text{tree}) \]
Downsides of Linear Probing

• What happens when $\lambda$ approaches 1?
• What happens when $\lambda$ exceeds 1?
Quadratic Probing: Insert Procedure

• To insert $k, v$
  • Calculate $i = h(k) \% \text{size}$
  • If $table[i]$ is occupied then try $(i + 1^2)\% \text{size}$
  • If that is occupied try $(i + 2^2)\% \text{size}$
  • If that is occupied try $(i + 3^2)\% \text{size}$
  • If that is occupied try $(i + 4^2)\% \text{size}$
  • ...

0 1 2 3 4 5 6 7 8 9
Quadratic Probing: Example

- Insert:
  - 76
  - 40
  - 48
  - 5
  - 55
  - 47
Using Quadratic Probing

• If you probe \textit{tablesize} times, you start repeating the same indices

• If \textit{tablesize} is prime and $\lambda < \frac{1}{2}$ then you’re guaranteed to find an open spot in at most $\text{tablesize}/2$ probes

• Helps with the clustering problem of linear probing, but does not help if many things hash to the same value
Double Hashing: Insert Procedure

• Given $h$ and $g$ are both good hash functions
• To insert $k, v$
  • Calculate $i = h(k) \% \text{size}$
  • If $\text{table}[i]$ is occupied then try $(i + g(k)) \% \text{size}$
  • If that is occupied try $(i + 2 \cdot g(k)) \% \text{size}$
  • If that is occupied try $(i + 3 \cdot g(k)) \% \text{size}$
  • If that is occupied try $(i + 4 \cdot g(k)) \% \text{size}$
  • ...

0 1 2 3 4 5 6 7 8 9
Rehashing

• If your load factor $\lambda$ gets too large, copy everything over to a larger hash table
  • To do this: make a new array with a new hash function
  • Re-insert all items into the new hash table with the new hash function
  • New hash table should be “roughly” double the size (but probably still want it to be prime)
