

CSE 332: Data Structures & Parallelism

Lecture 6: Recurrences

Ruth Anderson

Winter 2025

Recursive Binary Search

5	8	13	42	75	79	88	90	95	99
0	1	2	3	4	5	6	7	8	9

```
public static boolean binarySearch(List<Integer> lst, int k){
    return binarySearch(lst, k, 0, lst.size());
}
private static boolean binarySearch(List<Integer> lst, int k, int start, int end){
    if(start == end)
        return false;
    int mid = start + (end-start)/2;
    if(lst.get(mid) == k){
        return true;
    } else if(lst.get(mid) > k){
        return binarySearch(lst, k, start, mid);
    } else{
        return binarySearch(lst, k, mid+1, end);
    }
}
```

Analysis of Recursive Algorithms

- Overall structure of recursion:
 - Do some non-recursive “work”
 - Do one or more recursive calls on some portion of your input
 - Do some more non-recursive “work”
 - Repeat until you reach a base case
- Running time: $T(n) = T(p_1) + T(p_2) + \dots + T(p_x) + f(n)$
 - The time it takes to run the algorithm on an input of size n is:
 - The sum of how long it takes to run the same algorithm on each smaller input
 - Plus the total amount of non-recursive work done at that step
- Usually:
 - $T(n) = a \cdot T\left(\frac{n}{b}\right) + f(n)$
 - Called “divide and conquer”
 - $T(n) = T(n - c) + f(n)$
 - Called “chip and conquer”

How Efficient Is It?

- $T(n) = 1 + T\left(\left\lfloor \frac{n}{2} \right\rfloor\right)$
- Base case: $T(1) = 1$

$T(n)$ = “cost” of running the entire algorithm on an array of length n

Let's Solve the Recurrence!

$$T(1) = 1$$

$$T(n) = 1 + \cancel{T(n/2)}$$

$$1 + \cancel{T(n/4)}$$

$$1 + \cancel{T(n/8)}$$

...

1

Substitute until $T(1)$
So $\log_2 n$ steps

$$T(n) = \sum_{i=1}^{\log_2 n} 1 = \log_2 n$$

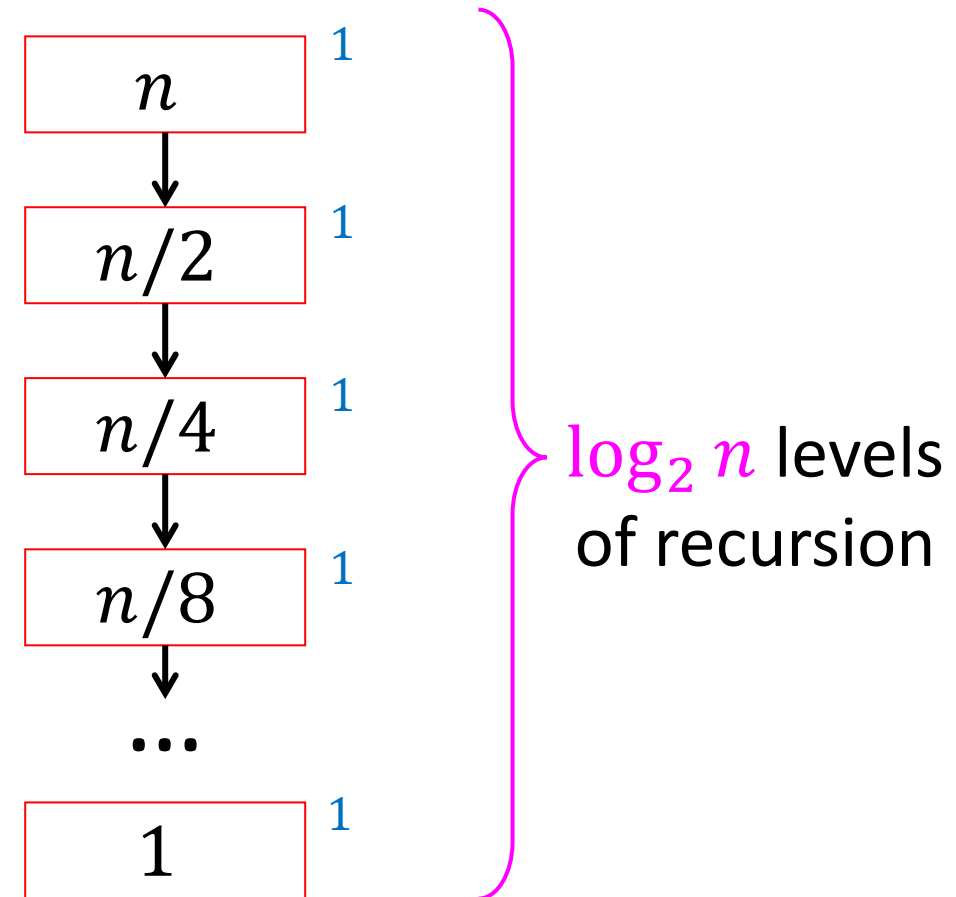

$$T(n) \in \Theta(\log n)$$

Make our process “prettier”

$$T(n) = T\left(\frac{n}{2}\right) + 1$$

- Draw a picture of the recursion
- Identify the work done per stack frame
- Add up all the work!
 - Sum is the answer!
 - In this case $\Theta(\log_2 n)$

The “Tree Method”

Recursive Linear Search

5	8	13	42	75	79	88	90	95	99
0	1	2	3	4	5	6	7	8	9

```
public static boolean linearSearch(List<Integer> lst, int k){
    return linearSearch(lst, k, 0, lst.size());
}
private static boolean linearSearch(List<Integer> lst, int k, int start, int end){
    if(start == end){
        return false;
    } else if(lst.get(start) == k){
        return true;
    } else{
        return linearSearch(lst, k, start+1, end);
    }
}
```

Make our method “prettier”

- Draw a picture of the recursion
- Identify the work done per stack frame
- Add up all the work!

Running time: $\Theta(n)$

$$T(n) = T(n - 1) + 1$$

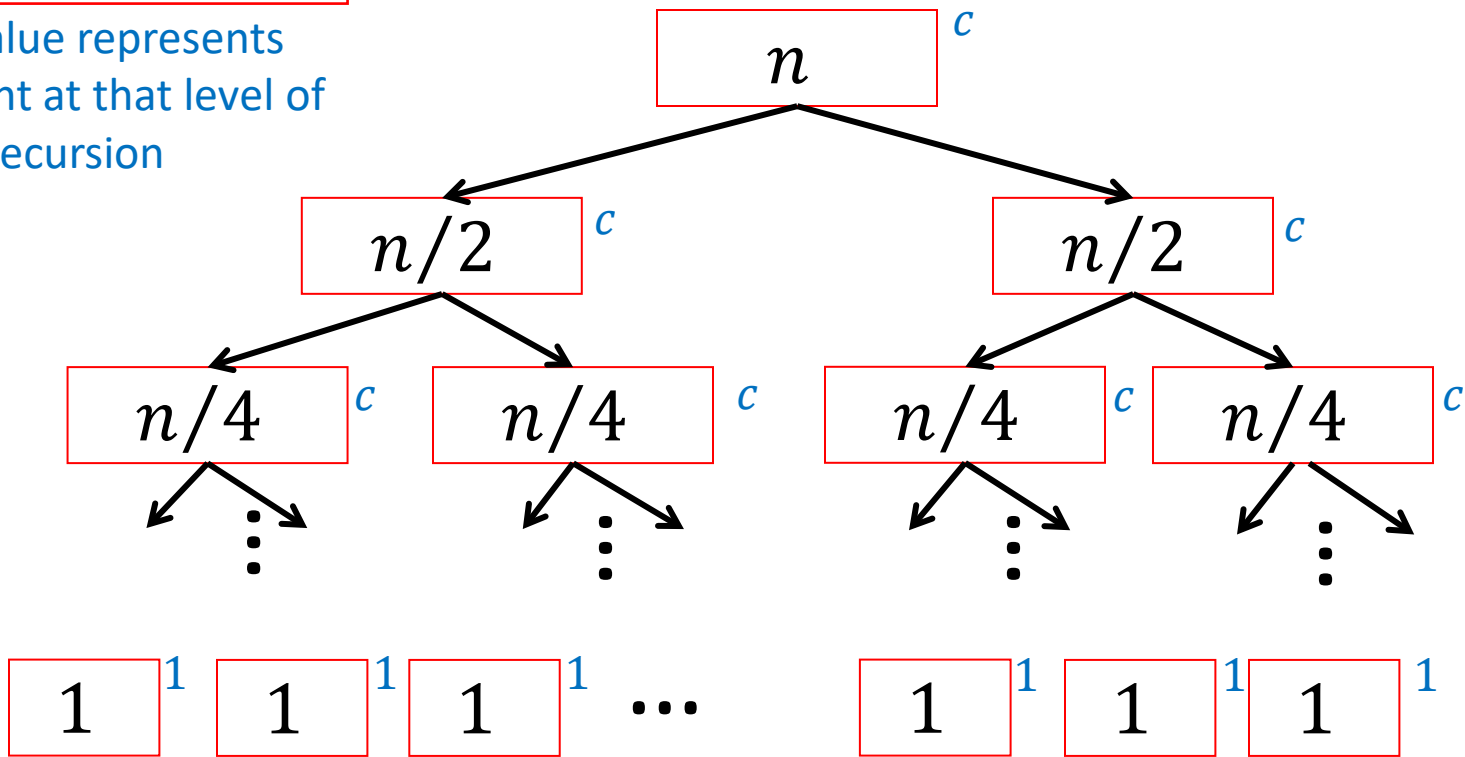

Recursive List Summation

```
public int sum(int[] list){
    return sum_helper(list, 0, list.size);
}
private int sum_helper(int[] list, int low, int high){
    if (low == high){ return 0; }
    if (low == high-1){ return list[low]; }
    int middle = (high+low)/2;
    return sum_helper(list, low, middle) + sum_helper(list, middle, high);
}
```

Tree Method: $T(n) = 2T\left(\frac{n}{2}\right) + c$

Red box represents a problem instance

Blue value represents time spent at that level of recursion

$\Rightarrow 2^i \cdot c$ work per level

$\log_2 n$ levels of recursion

$$T(n) = \sum_{i=0}^{(\log_2 n) - 1} 2^i \cdot c$$

Recursive List Summation

$$T(n) = \sum_{i=0}^{(\log_2 n) - 1} 2^i \cdot c$$

$$= c \cdot \sum_{i=0}^{(\log_2 n) - 1} 2^i$$

$$= c \left(\frac{1 - 2^{\log_2 n}}{1 - 2} \right)$$

[A “useful” Math Identity](#)
(see link on [exercises page](#))

$$\sum_{i=0}^{n-1} x^i = \frac{1-x^n}{1-x}$$

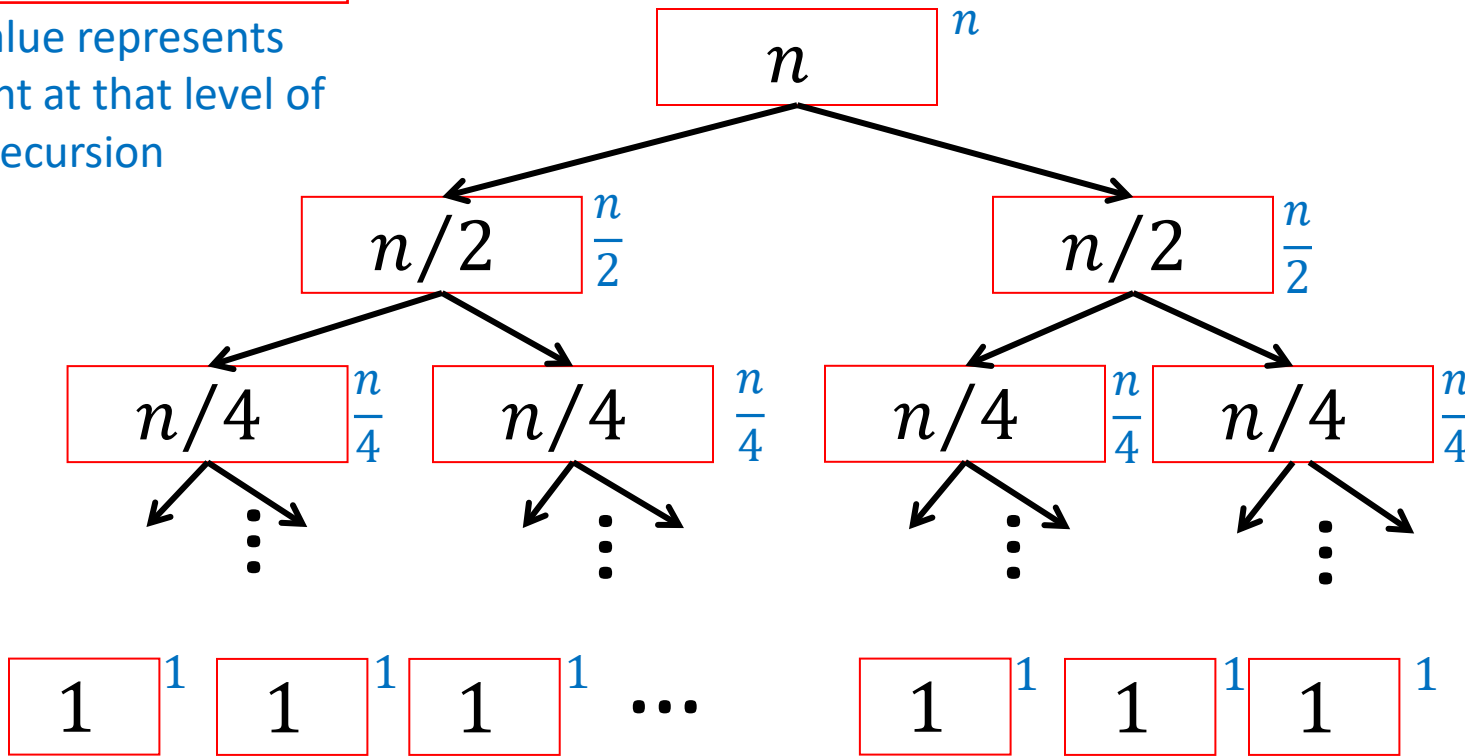

Let's do some more!

- For each, assume the base case is $n = 1$ and $T(1) = 1$
- $T(n) = 2T\left(\frac{n}{2}\right) + n$
- $T(n) = 2T\left(\frac{n}{2}\right) + n^2$
- $T(n) = 2T\left(\frac{n}{8}\right) + 1$

Tree Method: $T(n) = 2T\left(\frac{n}{2}\right) + n$

Red box represents a problem instance

Blue value represents time spent at that level of recursion

$\Rightarrow n$ work per level

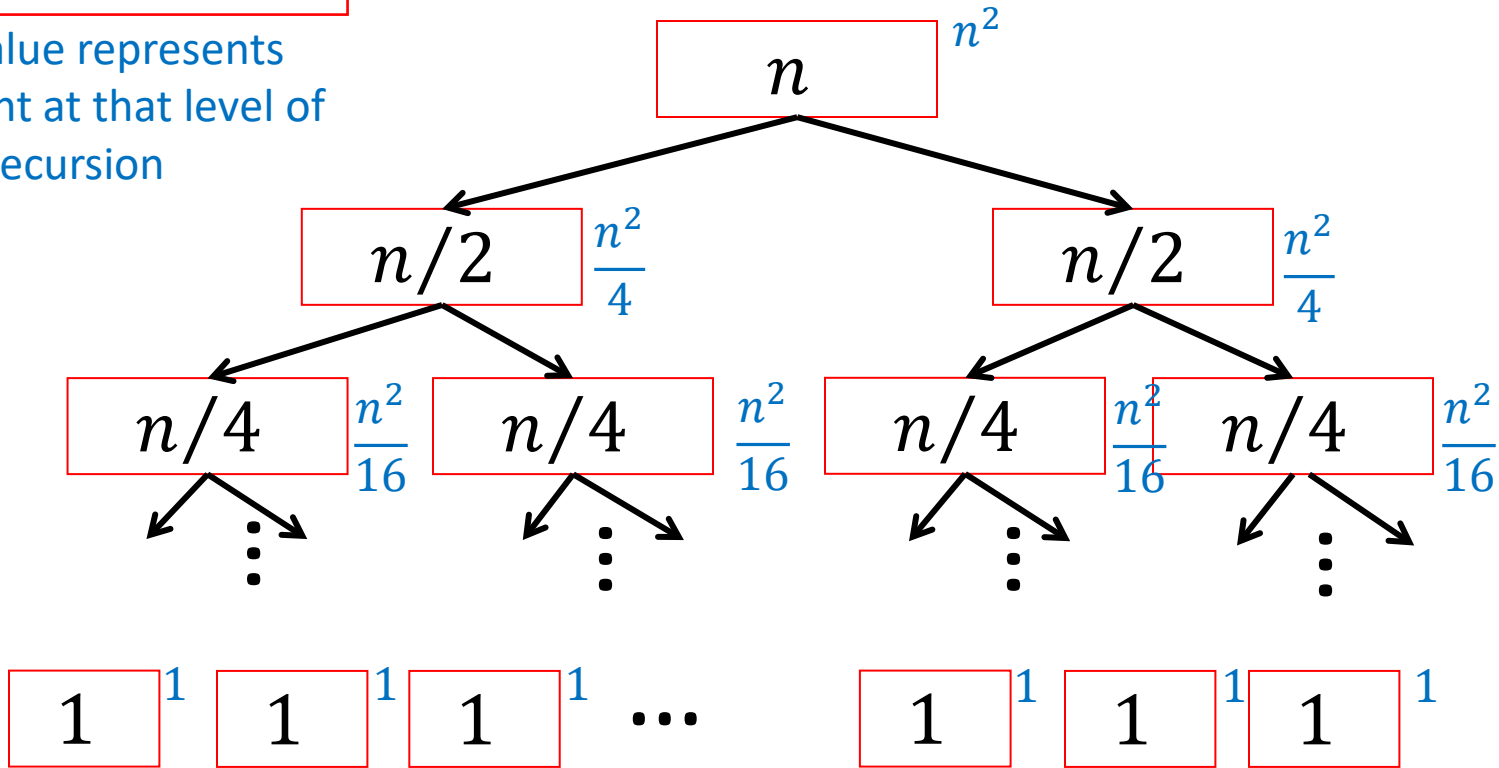

$\log_2 n$ levels of recursion

$$T(n) = \sum_{i=1}^{\log_2 n} n$$

Tree Method: $T(n) = 2T\left(\frac{n}{2}\right) + n^2$

Red box represents a problem instance

Blue value represents time spent at that level of recursion

\Rightarrow ?? work per level

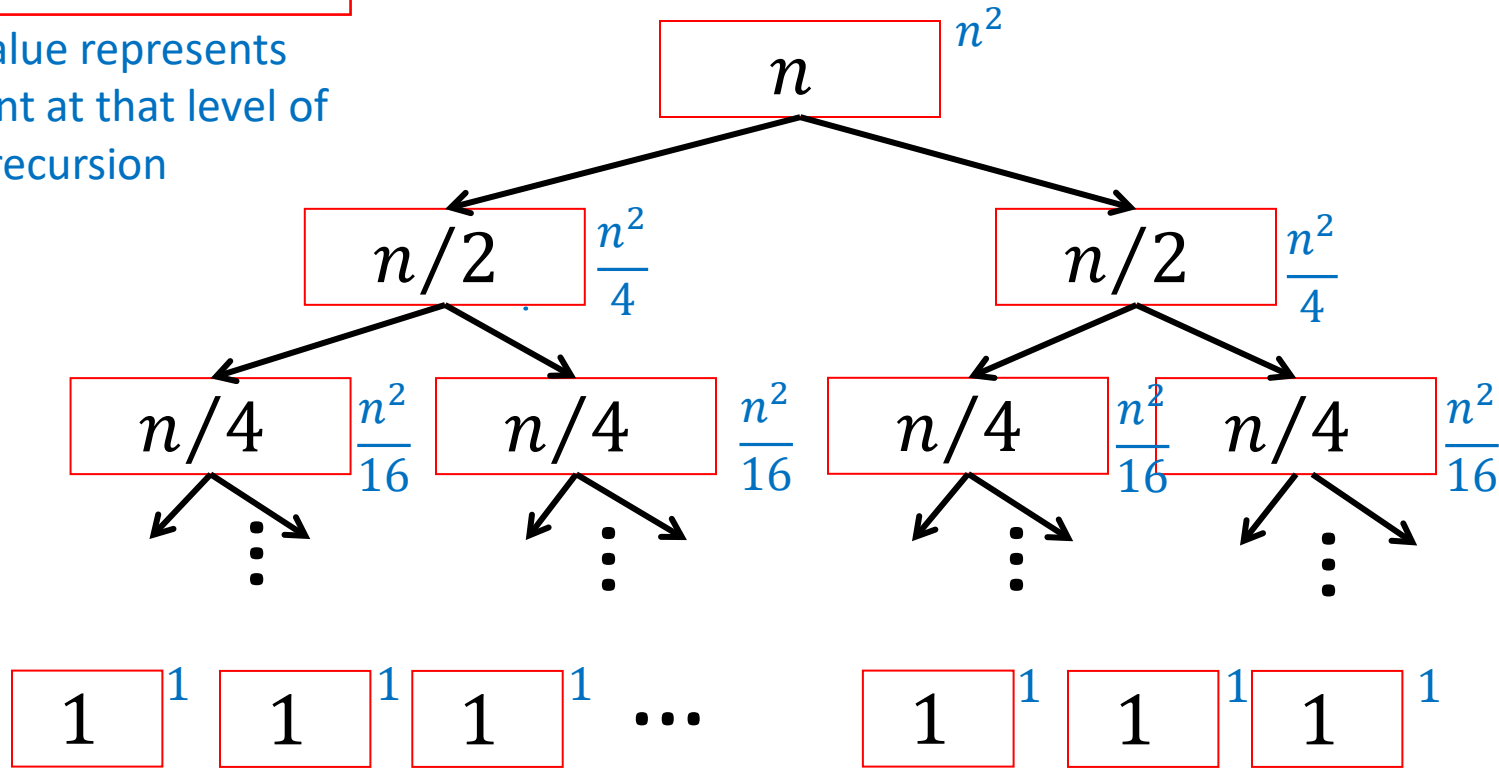

$\log_2 n$ levels of recursion

$$T(n) = \sum_{i=0}^{(\log_2 n) - 1} ??$$

Tree Method: $T(n) = 2T\left(\frac{n}{2}\right) + n^2$

Red box represents a problem instance

Blue value represents time spent at that level of recursion

$\Rightarrow \frac{n^2}{2^i}$ work per level

$\log_2 n$ levels of recursion

$$T(n) = \sum_{i=0}^{(\log_2 n) - 1} \frac{n^2}{2^i}$$

$$T(n) = \sum_{i=0}^{(\log_2 n) - 1} \frac{n^2}{2^i}$$

$$= n^2 \cdot \sum_{i=0}^{(\log_2 n) - 1} \left(\frac{1}{2}\right)^i$$

[A “useful” Math Identity](#)
(see link on [exercises page](#))

$$\sum_{i=0}^{n-1} x^i = \frac{1-x^n}{1-x}$$

$$\begin{aligned}
T(n) &= \sum_{i=0}^{(\log_2 n) - 1} \frac{n^2}{2^i} \\
&= n^2 \cdot \sum_{i=0}^{(\log_2 n) - 1} \left(\frac{1}{2}\right)^i \\
&= n^2 \cdot \left(\frac{\frac{1}{n} - 1}{\frac{1}{2} - 1}\right) = \Theta(n^2)
\end{aligned}$$

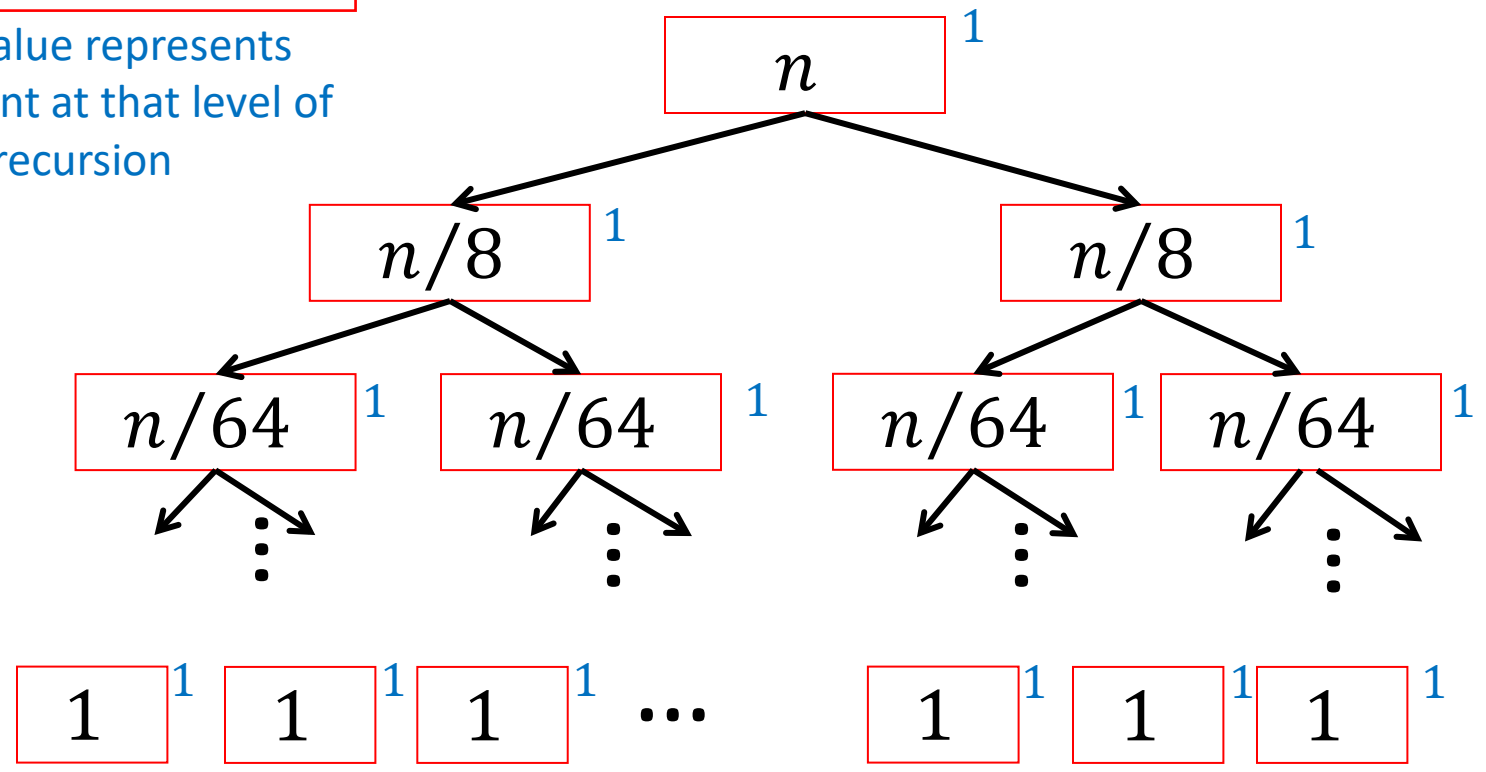

A “useful” Math Identity
(see link on [exercises page](#))

$$\sum_{i=0}^{n-1} x^i = \frac{1-x^n}{1-x}$$

Tree Method: $T(n) = 2T\left(\frac{n}{8}\right) + 1$

Red box represents a problem instance

Blue value represents time spent at that level of recursion

$\Rightarrow 2^i$ work per level

$\log_8 n$ levels of recursion

$$T(n) = \sum_{i=0}^{(\log_8 n)-1} 2^i$$

$$\begin{aligned} T(n) &= \sum_{i=0}^{(\log_8 n)-1} 2^i \\ &= \left(\frac{1 - 2^{\log_8 n}}{1 - 2} \right) \\ &= 2^{\log_8 n} - 1 \\ &= n^{\log_8 2} = n^{\frac{1}{3}} \end{aligned}$$

A “useful” Math Identity
(see link on [exercises page](#))

$$\sum_{i=0}^{n-1} x^i = \frac{1-x^n}{1-x}$$

$$a^{\log_b c} = c^{\log_b a}$$

What matters, recursively

- For $T(n) = aT\left(\frac{n}{b}\right) + f(n)$
 - The following are important for asymptotic behavior:
 - The value of a
 - The value of b
 - Asymptotic behavior of $f(n)$
 - The following are not important for asymptotic behavior:
 - Constants and non-dominant terms in $f(n)$
 - The base case

Really common recurrences

Should know how to solve recurrences but also recognize some really common ones:

$$T(n) = O(1) + T(n/2)$$

logarithmic $O(\log n)$

$$T(n) = O(1) + 2T(n/2)$$

linear $O(n)$

$$T(n) = O(1) + T(n-1)$$

linear $O(n)$

$$T(n) = O(n) + T(n-1)$$

quadratic $O(n^2)$

$$T(n) = O(1) + 2T(n-1)$$

exponential $O(2^n)$

$$T(n) = O(n) + T(n/2)$$

linear $O(n)$

$$T(n) = O(n) + 2T(n/2)$$

loglinear $O(n \log n)$
