CSE 333 Lecture 16 -- networks

Hal Perkins

Department of Computer Science & Engineering University of Washington

CSE333 lec 16 networks // 05-20-13 // Perkins

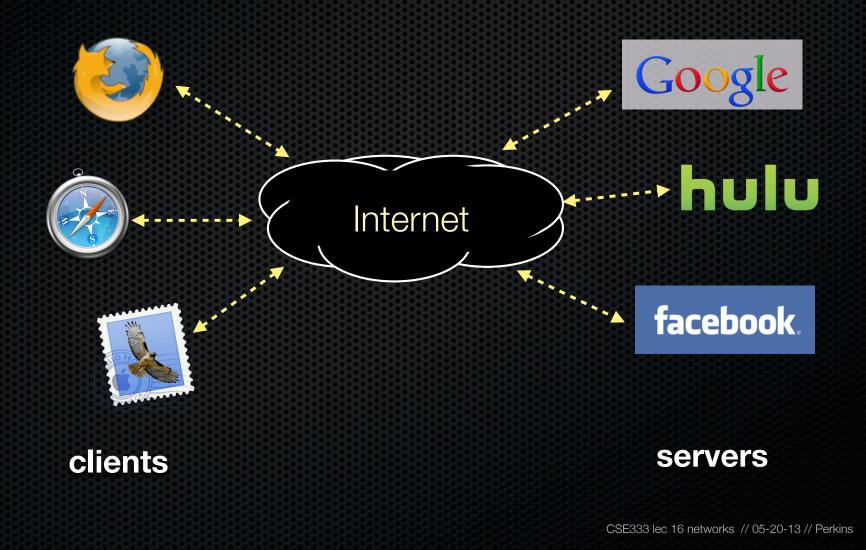

Administrivia

HW3 due Thursday night

- No exercises until after that
- But with the long weekend coming up, maybe two due right afterwards? (Tuesday morning instead of Monday, then Wed.)

HW4 out by end of the week

Networks from 10,000ft

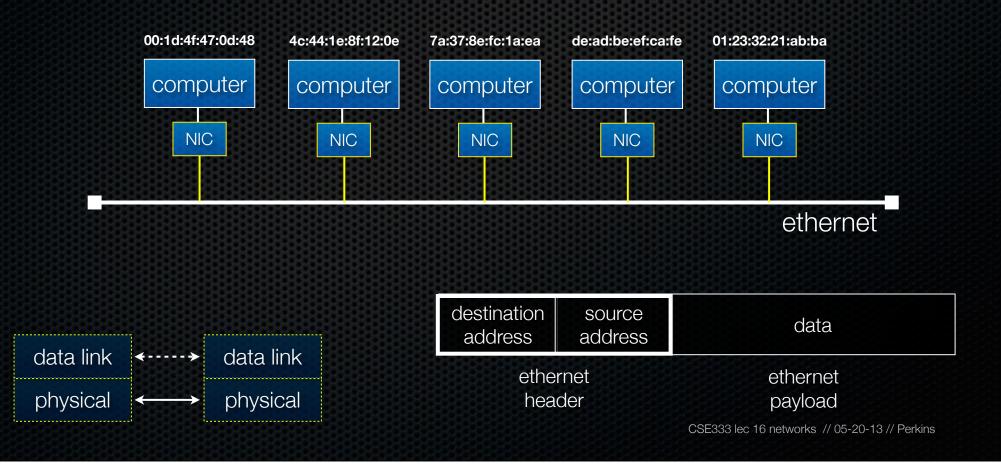

The "physical" layer

Individual bits are modulated onto a wire or transmitted over radio physical layer specifies how bits are encoded at a signal level ▶ e.g., a simple spec would encode "1" as +1V, "0" as -1V 10101 copper wire computer computer optical cable radio frequency band NIC NIC physical physical CSE333 lec 16 networks // 05-20-13 // Perkins

The "data link" layer

Multiple computers on a LAN contend for the network medium

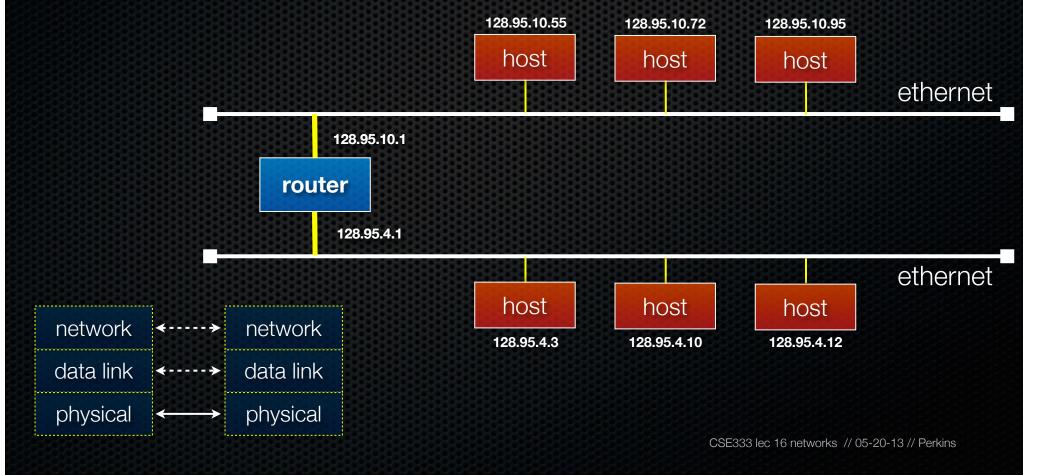

- media access control (MAC) specifies how computers cooperate
- link layer also specifies how bits are packetized and NICs are addressed

The "network" layer (IP)

The Internet Protocol (IP) routes packets across multiple networks

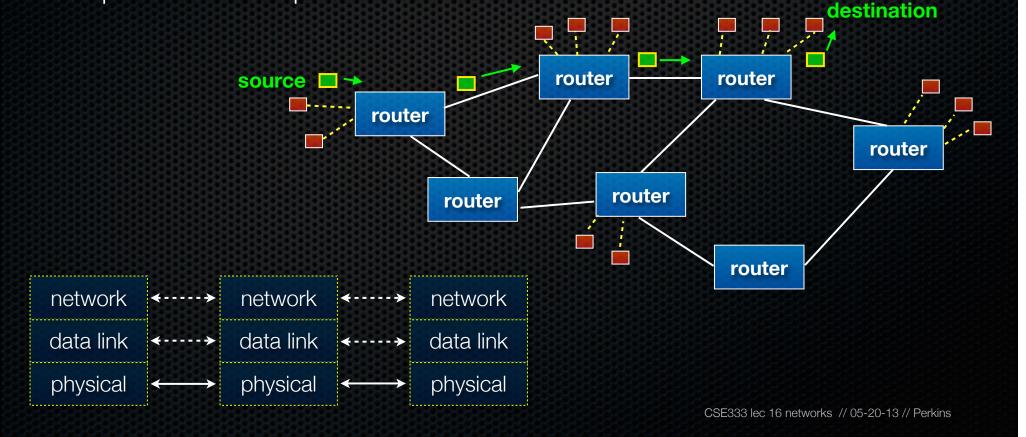

- every computer has a unique Internet address (IP address)
- individual networks are connected by routers that span networks

The "network" layer (IP)

Protocols to:

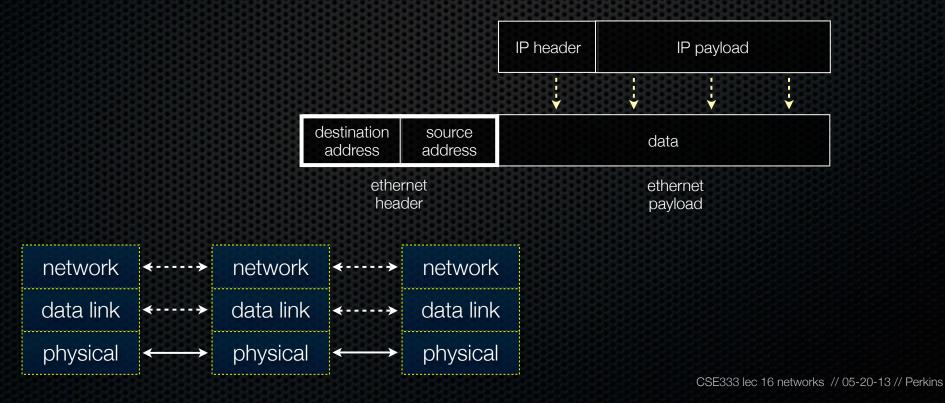

- let a host find the MAC address of an IP address on the same network
- let a router learn about other routers and figure out how to get IP packets one step closer to their destination

The "network" layer (IP)

Packet encapsulation

- an IP packet is encapsulated as the payload of an Ethernet frame
- as IP packets traverse networks, routers pull out the IP packet from an ethernet frame and plunk it into a new one on the next network

The "transport" layer (TCP, UDP)

TCP

- the "transmission control protocol"
- provides apps with reliable, ordered, congestion-controlled byte streams
- fabricates them by sending multiple IP packets, using sequence numbers to detect missing packets, and retransmitting them
- a single host (IP address) can have up to 65,535 "ports"
 - kind of like an apartment number at a postal address

-0-			0-0-0-0-0-0-0-0	00000	
	transport	∢	transport		
	network	∢ ·····≯	network	∢ >	network
	data link	∢ ·····≯	data link	∢ >	data link
	physical	\longleftrightarrow	physical	\longleftrightarrow	physical

The "transport" layer (TCP, UDP)

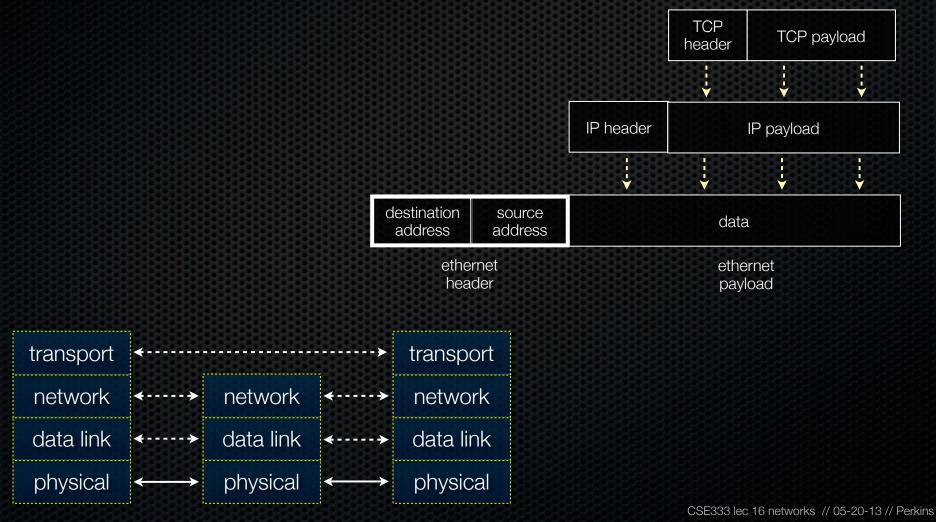

TCP

- useful analogy: how would you send a book by mail via postcards?
- split the book into multiple postcards, send each one by one, including sequence numbers that indicate the assembly order
- receiver sends back postcards to acknowledge receipt and indicate which got lost in the mail

÷.,-					
	transport	∢	transport		
	network	∢ ·····>	network	∢ >	network
	data link	∢ ·····>	data link	∢ >	data link
	physical	\longleftrightarrow	physical	\longleftrightarrow	physical

The "transport" layer (TCP)

Packet encapsulation -- same as before!

The "transport" layer (TCP)

Applications use OS services to establish TCP streams

- the "Berkeley sockets" API -- a set of OS system calls
- clients connect() to a server IP address + application port number
- servers listen() for and accept() client connections
- clients, servers read() and write() data to each other

transport	∢		>	transport
network	∢ →	network	∢ >	network
data link	∢ ·····>	data link	∢ >	data link
physical	\longleftrightarrow	physical	\longleftrightarrow	physical

The "transport" layer (UDP)

UDP

- the "user datagram protocol"
- provides apps with unreliable packet delivery
- UDP datagrams are fragmented into multiple IP packets
 - UDP is a really thin, simple layer on top of IP

transp	ort <		transport	
netwo	rk ≺	→ networl	₭ 	network
data li	nk	🔸 data lin	k	data link
physic	al ←	→ physica	al 🔶	physical

The (mostly missing) layers 5,6

presentation	∢	presentation		
session	«	session		
transport	«	transport		
network	«····· »	network	∢ >	network
data link	∢ ·····≯	data link	∢ ·····>	data link
physical	\longleftrightarrow	physical	\longleftrightarrow	physical

Layer 5: session layer

- supposedly handles establishing, terminating application sessions
- RPC kind of fits in here

Layer 6: presentation layer

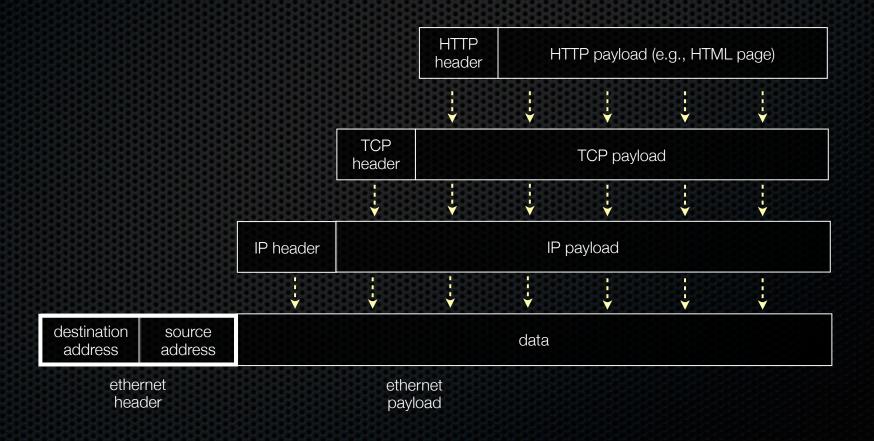

- supposedly maps applicationspecific data units into a more network-neutral representation
- encryption (SSL) kind of fits in here

	0-0-0-0-0		x0+0+0+0+0+	
application	∢		>	application
presentation	∢		·····>	presentation
session	≪		·····>	session
transport	∢		·····>	transport
network	∢ ·····≯	network	∢ >	network
data link	∢ ·····≯	data link	∢ ·····≯	data link
physical	\longleftrightarrow	physical	\longleftrightarrow	physical

Application protocols

- the format and meaning of messages between application entities
- e.g., HTTP is an application level protocol that dictates how web browsers and web servers communicate
 - HTTP is implemented on top of TCP streams

Packet encapsulation -- same as before!

Packet encapsulation -- same as before!

ethernet header	IP header	TCP header	HTTP header	HTTP payload (e.g., HTML page)
--------------------	-----------	---------------	----------------	--------------------------------

Popular application-level protocols:

- **DNS**: translates a DNS name (**www.google.com**) into one or more IP addresses (74.125.155.105, 74.125.155.106, ...)
 - a hierarchy of DNS servers cooperate to do this
- HTTP: web protocols
- SMTP, IMAP, POP: mail delivery and access protocols
- **ssh**: remote login protocol
- bittorrent: peer-to-peer, swarming file sharing protocol

See you on Wednesday!
