

CSE 333

Lecture 3 - pointers, pointers, pointers

Hal Perkins

Department of Computer Science & Engineering

University of Washington

Administrivia 1

hw0 out, due Tuesday night

Infrastructure shakedown cruise. Basic assignment should be pretty simple

clint and valgrind tools will be useful for exercises also

Need to get this into your CSE gitlab repo. Use discussion board to sort out issues; mail to cse333-staff@cs as needed

ex2 out now, due Monday before class

Administrivia 2

Exercise grading

Still a work in progress

Some things to watch for:

No input sanity check (i.e., there should be an argument, it should be an int)

Single blob of code, no functions

Formatting funnies (tabs, not spaces) - likely just a warning this time

Suggestion: now that you have `clint.py`, use it to check exercises

Coding question: why compute x^y to alternate $+-+-+-\dots$?

Administrivia 3

Documentation vs Folklore

Documentation: man pages; books; reference web sites like cplusplus.com, man7.org; ...

Folklore: google, stackoverflow, the person down the hall

Tradeoffs, relative strengths/weaknesses

Discuss

Agenda

Today's goals:

pointers

more pointers

pointers and call-by-reference

arrays and pointers

& and *

&foo // virtual address of foo - “address of”
**pointer* // dereference a pointer
**pointer = value;* // dereference / assign

deref.c

```
int x = 42;
int *p;          // p is a pointer to an integer
p = &x;          // p now stores the address of x

printf("x  is %d\n", x);
*p = 99;
printf("x  is %d\n", x);
```

Something curious

Let's try running this program several times:

asr.c

```
#include <stdio.h>

int main(int argc, char **argv) {
    int x = 1;
    int *p = &x;

    printf("&x: %p;    p: %p;    &p: %p\n",
           &x, p, &p);
    return 0;
}
```

```
[bash]$ ./asr
&x: 0xbfa521dc;    p: 0xbfa521dc;    &p: 0xbfa521d8
[bash]$ ./asr
&x: 0xbf836f5c;    p: 0xbf836f5c;    &p: 0xbf836f58
[bash]$ ./asr
&x: 0xbfea39dc;    p: 0xbfea39dc;    &p: 0xbfea39d8
```

ASR

Linux uses address-space randomization for added security

linux randomizes:

base of stack

shared library (mmap) location

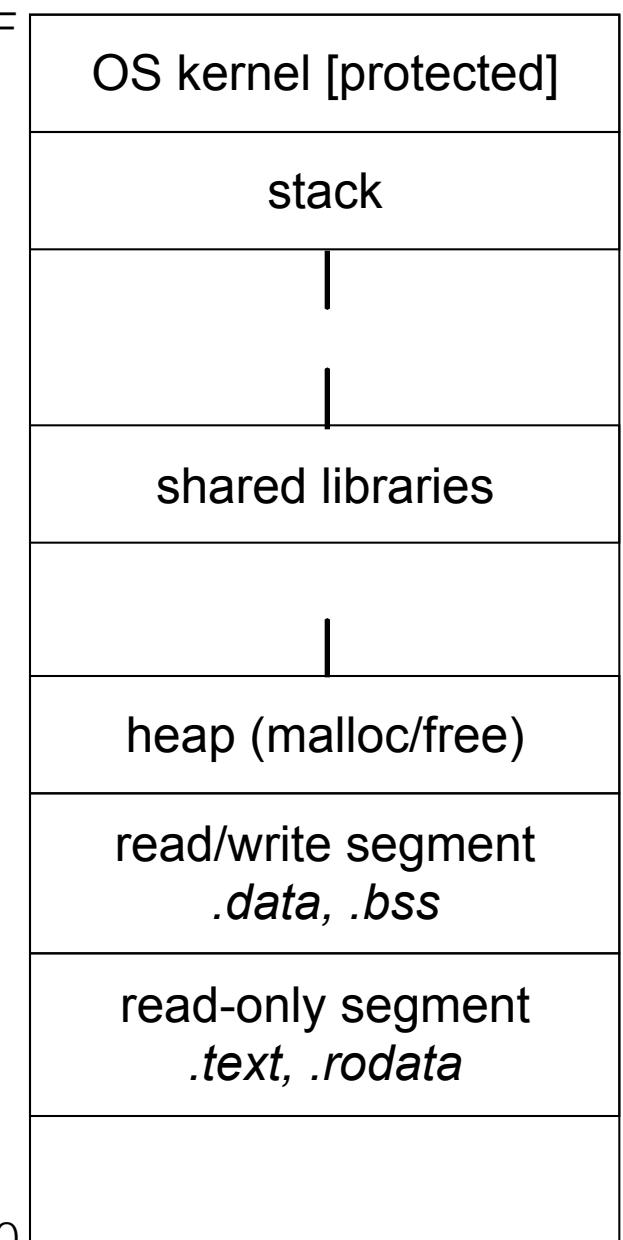

makes stack-based buffer overflow attacks tougher

makes debugging tougher

google “disable linux address space randomization”

0xFFFFFFFF

0x00000000

Box and arrow diagrams

boxarrow.c

```
int main(int argc, char **argv) {
    int x = 1;
    int arr[3] = {2, 3, 4};
    int *p = &arr[1];

    printf("&x: %p;  x: %d\n", &x, x);
    printf("&arr[0]: %p;  arr[0]: %d\n", &arr[0], arr[0]);
    printf("&arr[2]: %p;  arr[2]: %d\n", &arr[2], arr[2]);
    printf("&p: %p;  p: %p;  *p: %d\n", &p, p, *p);

    return 0;
}
```

address

name	value
------	-------

&x	x	value
----	---	-------

&arr[0]	arr[0]	value
&arr[1]	arr[1]	value
&arr[2]	arr[2]	value

&p	p	value
----	---	-------

Box and arrow diagrams

boxarrow.c

```
int main(int argc, char **argv) {
    int x = 1;
    int arr[3] = {2, 3, 4};
    int *p = &arr[1];

    printf("&x: %p;  x: %d\n", &x, x);
    printf("&arr[0]: %p;  arr[0]: %d\n", &arr[0], arr[0]);
    printf("&arr[2]: %p;  arr[2]: %d\n", &arr[2], arr[2]);
    printf("&p: %p;  p: %p;  *p: %d\n", &p, p, *p);

    return 0;
}
```

Pointer arithmetic

Pointers are typed

```
int *int_ptr;    vs.    char *char_ptr;
```

pointer arithmetic obeys those types

see *pointerarithmetic.c*

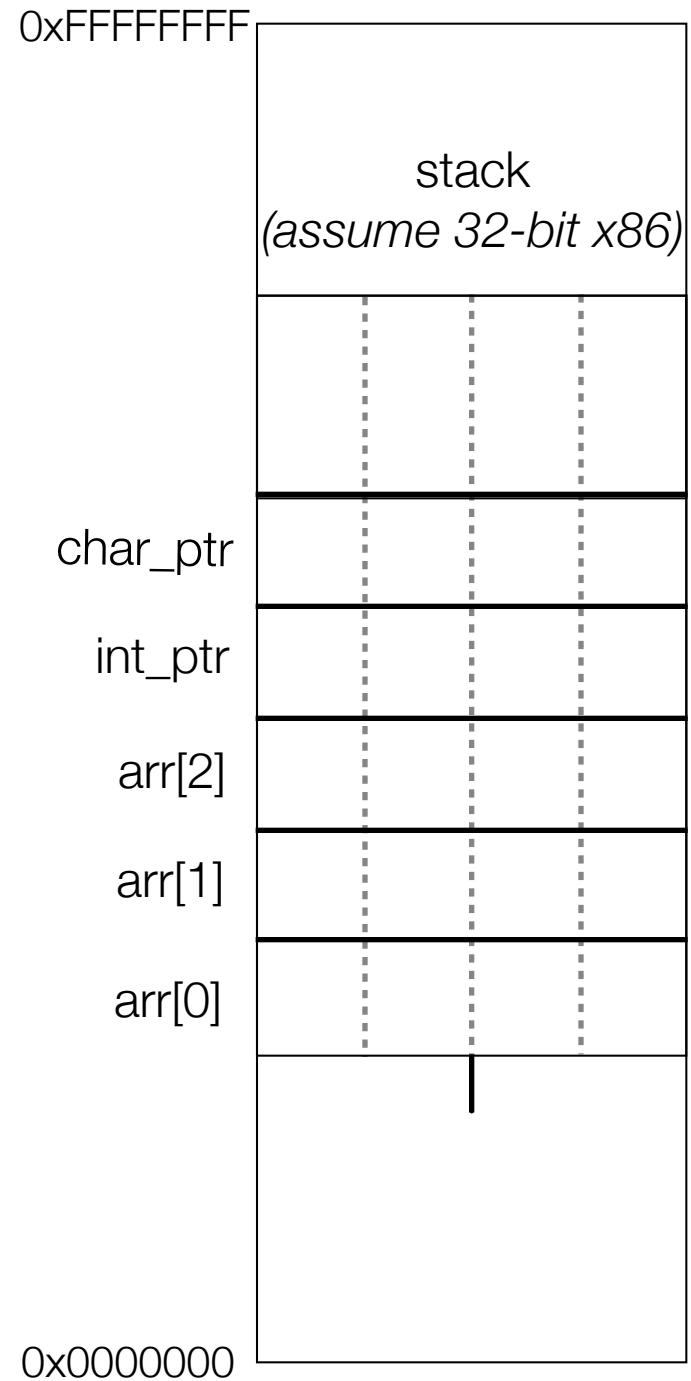

```
#include <stdio.h>

int main(int argc, char **argv) {
    int arr[3] = {1, 2, 3};
    int *int_ptr = &arr[0];
    char *char_ptr = (char *) int_ptr;

    printf("int_ptr: %p;    *int_ptr: %d\n",
           int_ptr, *int_ptr);
    int_ptr += 1;
    printf("int_ptr: %p;    *int_ptr: %d\n",
           int_ptr, *int_ptr);
    int_ptr += 2; // uh oh
    printf("int_ptr: %p;    *int_ptr: %d\n",
           int_ptr, *int_ptr);

    printf("char_ptr: %p;    *char_ptr: %d\n",
           char_ptr, *char_ptr);
    char_ptr += 1;
    printf("char_ptr: %p;    *char_ptr: %d\n",
           char_ptr, *char_ptr);
    char_ptr += 2;
    printf("char_ptr: %p;    *char_ptr: %d\n",
           char_ptr, *char_ptr);

    return 0;
}
```

```

#include <stdio.h>

int main(int argc, char **argv) {
    int arr[3] = {1, 2, 3};
    int *int_ptr = &arr[0];
    char *char_ptr = (char *) int_ptr;

    printf("int_ptr: %p;  *int_ptr: %d\n",
           int_ptr, *int_ptr);
    int_ptr += 1;
    printf("int_ptr: %p;  *int_ptr: %d\n",
           int_ptr, *int_ptr);
    int_ptr += 2; // uh oh
    printf("int_ptr: %p;  *int_ptr: %d\n",
           int_ptr, *int_ptr);

    printf("char_ptr: %p;  *char_ptr: %d\n",
           char_ptr, *char_ptr);
    char_ptr += 1;
    printf("char_ptr: %p;  *char_ptr: %d\n",
           char_ptr, *char_ptr);
    char_ptr += 2;
    printf("char_ptr: %p;  *char_ptr: %d\n",
           char_ptr, *char_ptr);

    return 0;
}

```

pointerarithmetic.c

stack
(assume 32-bit x86)

(x86 is little endian)

```
#include <stdio.h>

int main(int argc, char **argv) {
    int arr[3] = {1, 2, 3};
    int *int_ptr = &arr[0];
    char *char_ptr = (char *) int_ptr;

    printf("int_ptr: %p;    *int_ptr: %d\n",
           int_ptr, *int_ptr);
    int_ptr += 1;
    printf("int_ptr: %p;    *int_ptr: %d\n",
           int_ptr, *int_ptr);
    int_ptr += 2; // uh oh
    printf("int_ptr: %p;    *int_ptr: %d\n",
           int_ptr, *int_ptr);

    printf("char_ptr: %p;    *char_ptr: %d\n",
           char_ptr, *char_ptr);
    char_ptr += 1;
    printf("char_ptr: %p;    *char_ptr: %d\n",
           char_ptr, *char_ptr);
    char_ptr += 2;
    printf("char_ptr: %p;    *char_ptr: %d\n",
           char_ptr, *char_ptr);

    return 0;
}
```

stack

(assume 32-bit x86)

```

#include <stdio.h>

int main(int argc, char **argv) {
    int arr[3] = {1, 2, 3};
    int *int_ptr = &arr[0];
    char *char_ptr = (char *) int_ptr;

    printf("int_ptr: %p;  *int_ptr: %d\n",
           int_ptr, *int_ptr);
    int_ptr += 1;
    printf("int_ptr: %p;  *int_ptr: %d\n",
           int_ptr, *int_ptr);
    int_ptr += 2; // uh oh
    printf("int_ptr: %p;  *int_ptr: %d\n",
           int_ptr, *int_ptr);

    printf("char_ptr: %p;  *char_ptr: %d\n",
           char_ptr, *char_ptr);
    char_ptr += 1;
    printf("char_ptr: %p;  *char_ptr: %d\n",
           char_ptr, *char_ptr);
    char_ptr += 2;
    printf("char_ptr: %p;  *char_ptr: %d\n",
           char_ptr, *char_ptr);

    return 0;
}

```

pointerarithmetic.c

Pass-by-value

C passes arguments by **value**

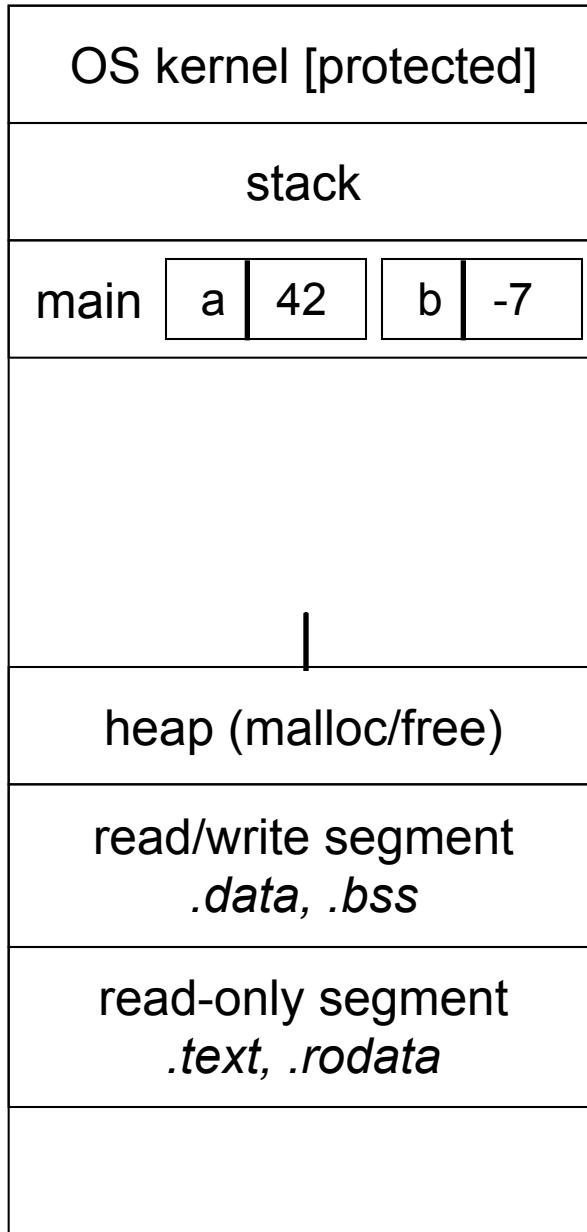

callee receives a **copy** of the argument

if the callee modifies an argument,
caller's copy isn't modified

```
void swap(int a, int b) {  
    int tmp = a;  
    a = b;  
    b = tmp;  
}  
  
int main(int argc, char **argv) {  
    int a = 42, b = -7;  
  
    swap(a, b);  
    printf("a: %d, b: %d\n", a, b);  
    return 0;  
}
```

brokenswap.c

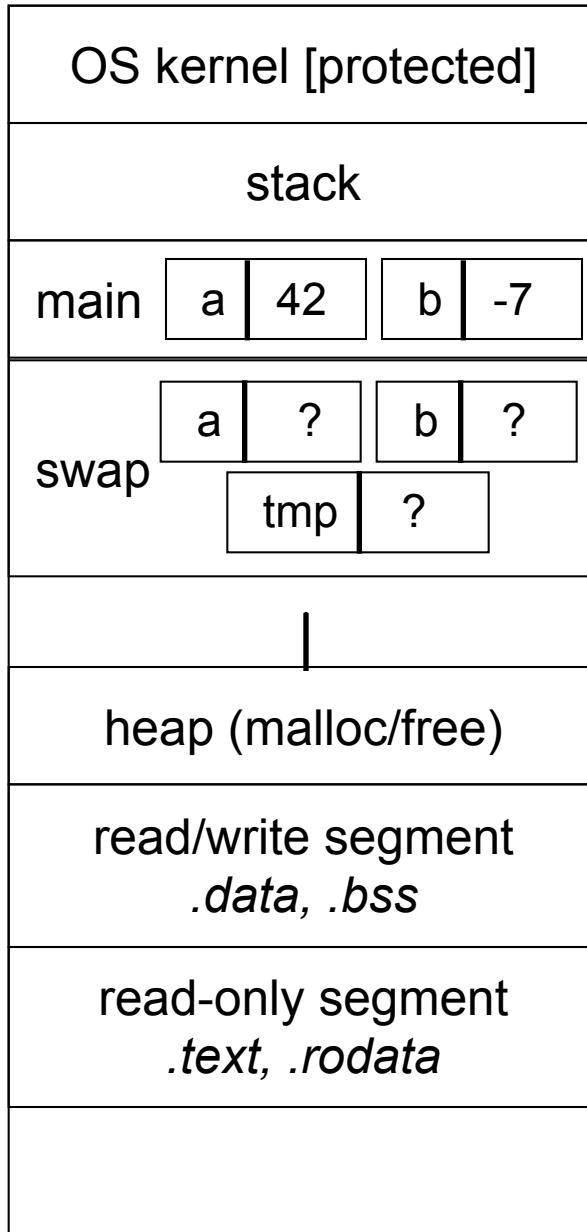

Pass-by-value (stack)

```
void swap(int a, int b) {  
    int tmp = a;  
    a = b;  
    b = tmp;  
}  
  
int main(int argc, char **argv) {  
    int a = 42, b = -7;  
  
    swap(a, b);  
    printf("a: %d, b: %d\n", a, b);  
    return 0;  
}
```

brokenswap.c

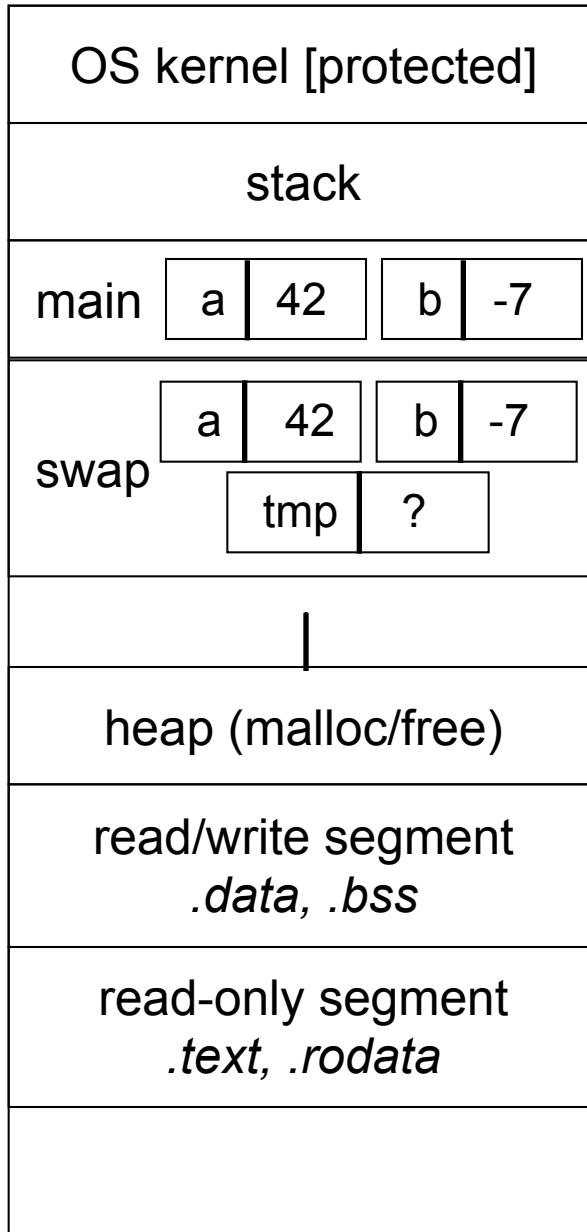

Pass-by-value (stack)

    int a = 42, b = -7;  
  
    swap(a, b);  
    printf("a: %d, b: %d\n", a, b);  
    return 0;  
}
```

brokenswap.c

Pass-by-reference

You can use pointers to pass by
reference

callee still receives a **copy** of the argument

but, the argument is a pointer

(so it's really call-by-value, but the value is a pointer)

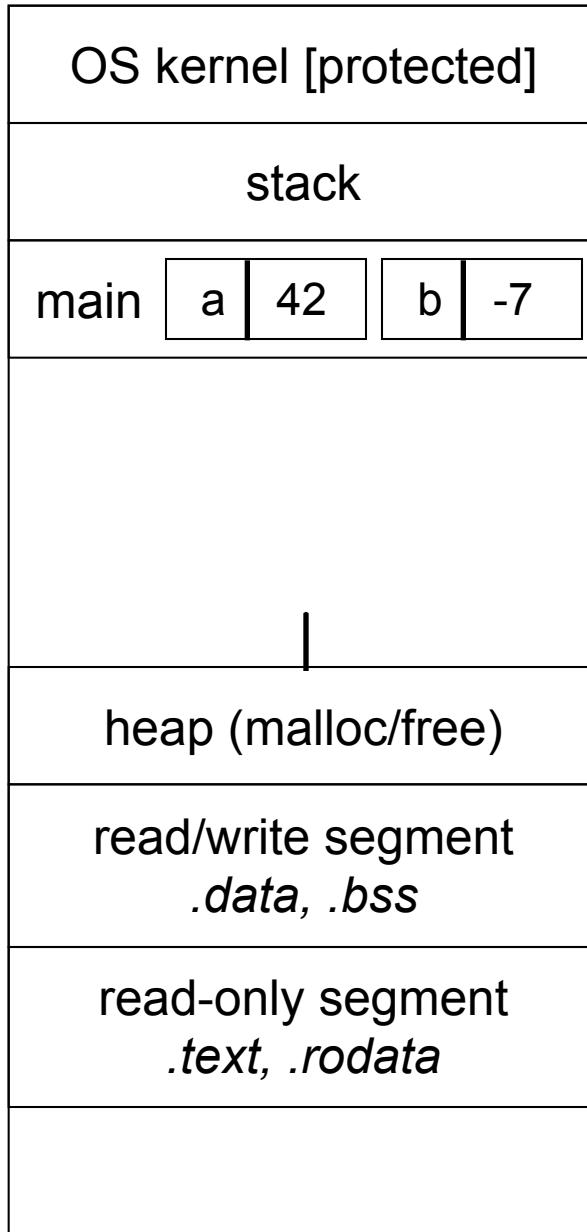

the pointer's value points-to the variable in the scope of the caller

this gives the callee a way to modify a variable that's in the scope of the caller

```
void swap(int *a, int *b) {  
    int tmp = *a;  
    *a = *b;  
    *b = tmp;  
}  
  
int main(int argc, char **argv) {  
    int a = 42, b = -7;  
  
    swap(&a, &b);  
    printf("a: %d, b: %d\n", a, b);  
    return 0;  
}
```

swap.c

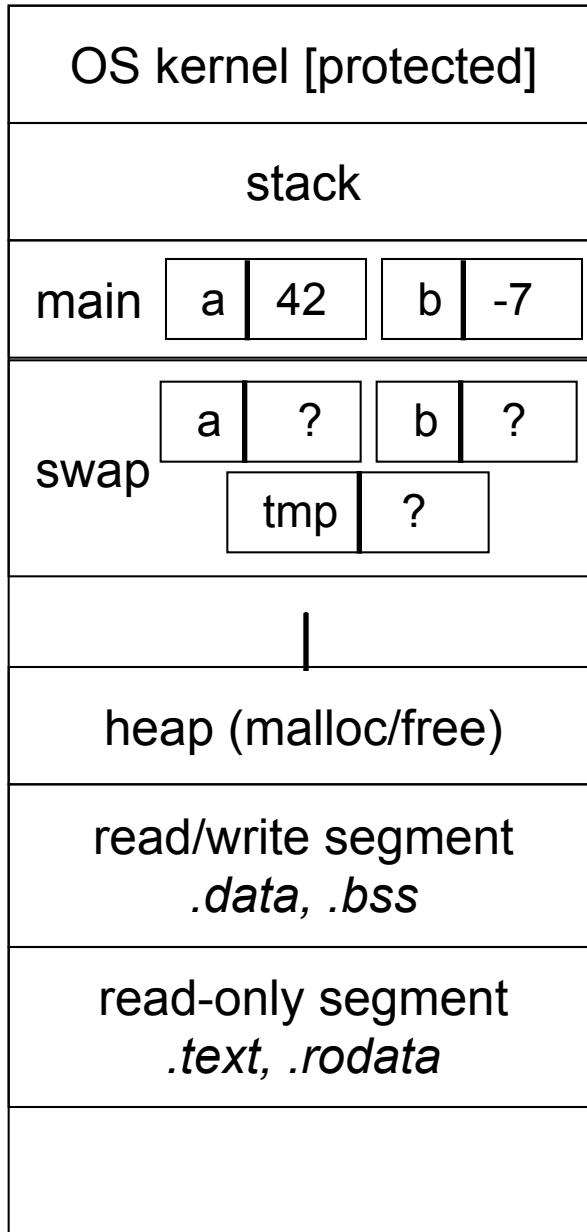

Pass-by-reference (stack)

```
void swap(int *a, int *b) {  
    int tmp = *a;  
    *a = *b;  
    *b = tmp;  
}  
  
int main(int argc, char **argv) {  
    int a = 42, b = -7;  
  
    swap(&a, &b);  
    printf("a: %d, b: %d\n", a, b);  
    return 0;  
}
```

swap.c

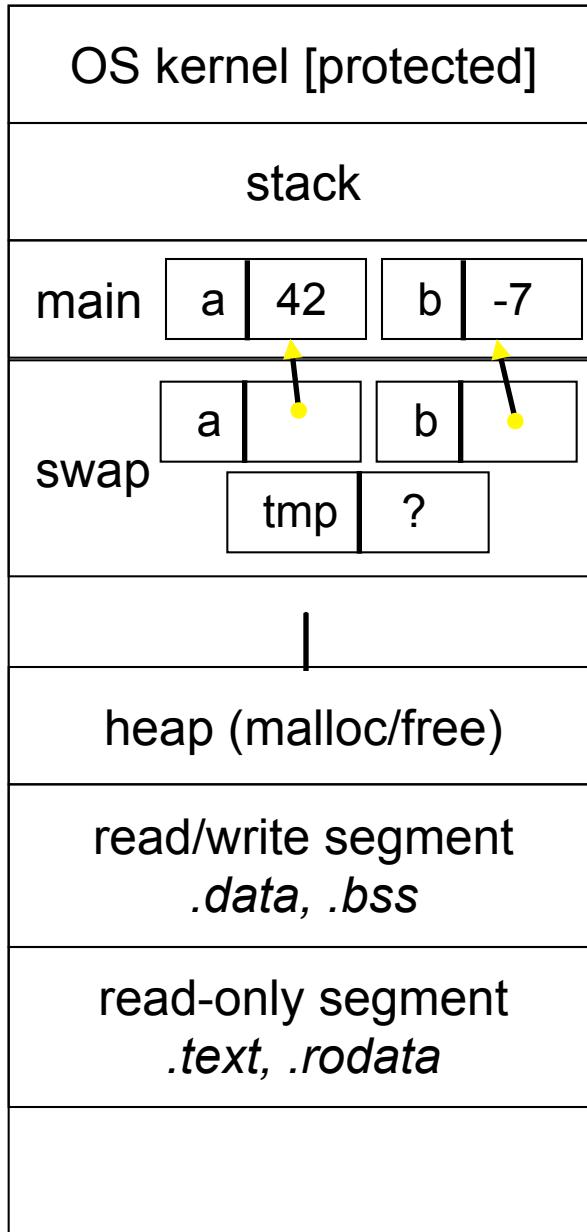

Pass-by-reference (stack)

```
void swap(int *a, int *b) {  
    int tmp = *a;  
    *a = *b;  
    *b = tmp;  
}  
  
int main(int argc, char **argv) {  
    int a = 42, b = -7;  
  
    swap(&a, &b);  
    printf("a: %d, b: %d\n", a, b);  
    return 0;  
}
```

swap.c

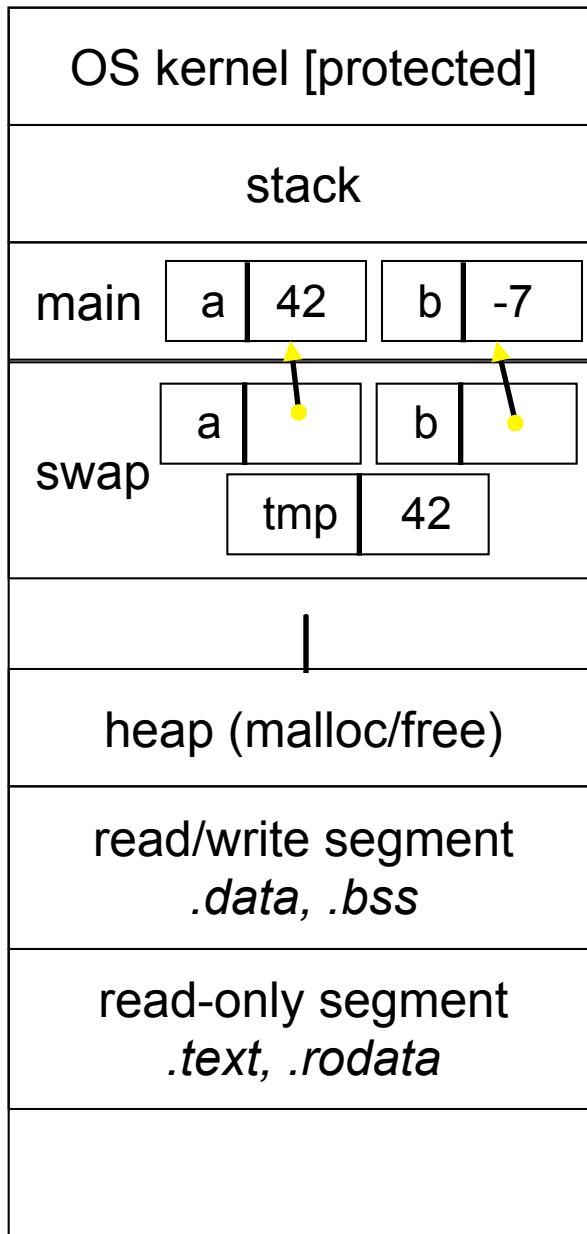

Pass-by-reference (stack)

```
void swap(int *a, int *b) {  
    int tmp = *a;  
    *a = *b;  
    *b = tmp;  
}  
  
int main(int argc, char **argv) {  
    int a = 42, b = -7;  
  
    swap(&a, &b);  
    printf("a: %d, b: %d\n", a, b);  
    return 0;  
}
```

swap.c

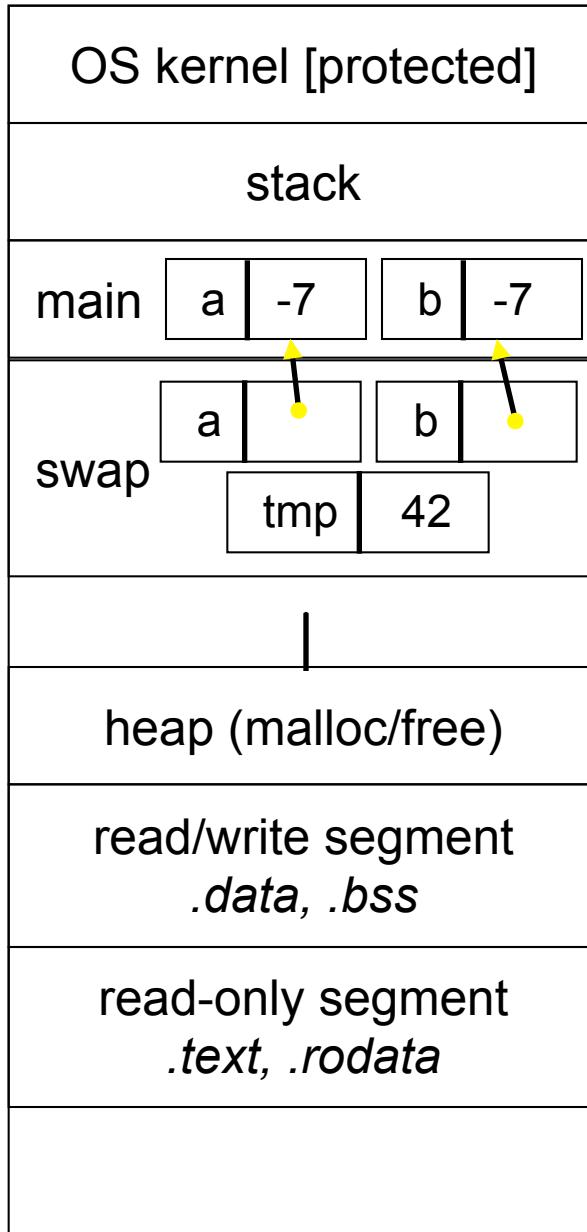

Pass-by-reference (stack)

```
void swap(int *a, int *b) {  
    int tmp = *a;  
    *a = *b;  
    *b = tmp;  
}  
  
int main(int argc, char **argv) {  
    int a = 42, b = -7;  
  
    swap(&a, &b);  
    printf("a: %d, b: %d\n", a, b);  
    return 0;  
}
```

swap.c

Pass-by-reference (stack)

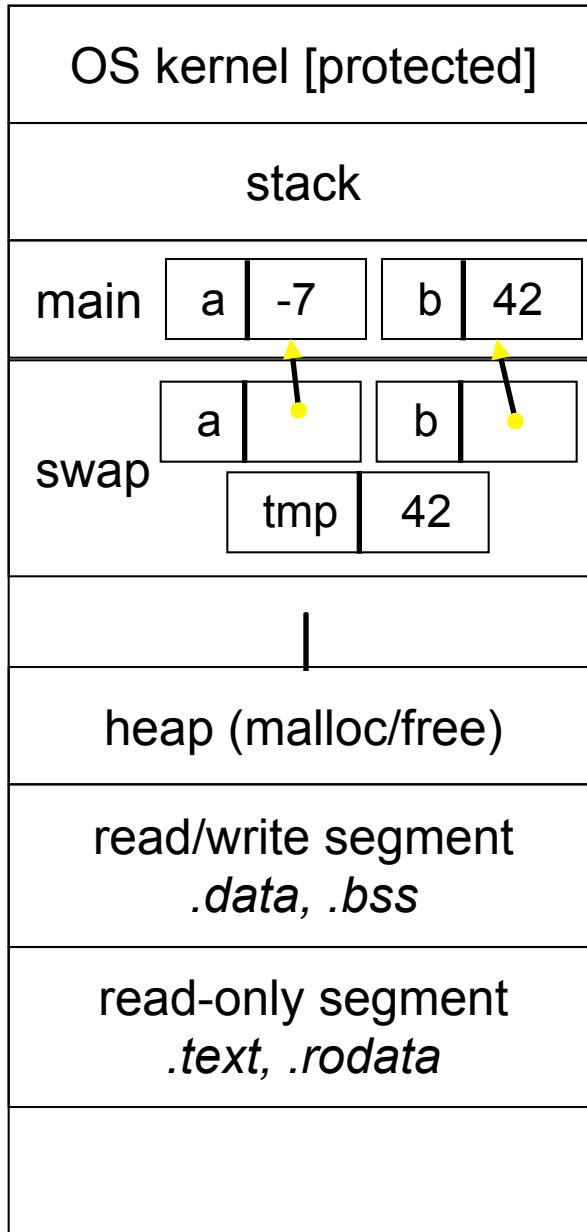

```
void swap(int *a, int *b) {
    int tmp = *a;
    *a = *b;
    *b = tmp;
}

int main(int argc, char **argv) {
    int a = 42, b = -7;

    swap(&a, &b);
    printf("a: %d, b: %d\n", a, b);
    return 0;
}
```

swap.c

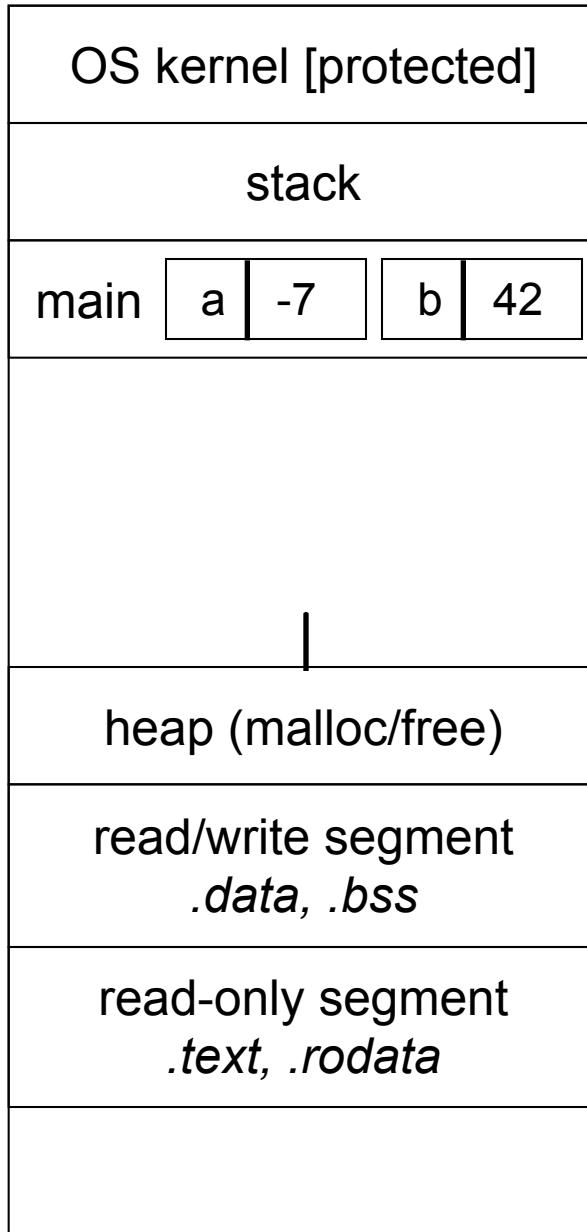

Pass-by-reference (stack)

```
void swap(int *a, int *b) {  
    int tmp = *a;  
    *a = *b;  
    *b = tmp;  
}  
  
int main(int argc, char **argv) {  
    int a = 42, b = -7;  
  
    swap(&a, &b);  
    printf("a: %d, b: %d\n", a, b);  
    return 0;  
}
```

swap.c

Pass-by-reference (stack)

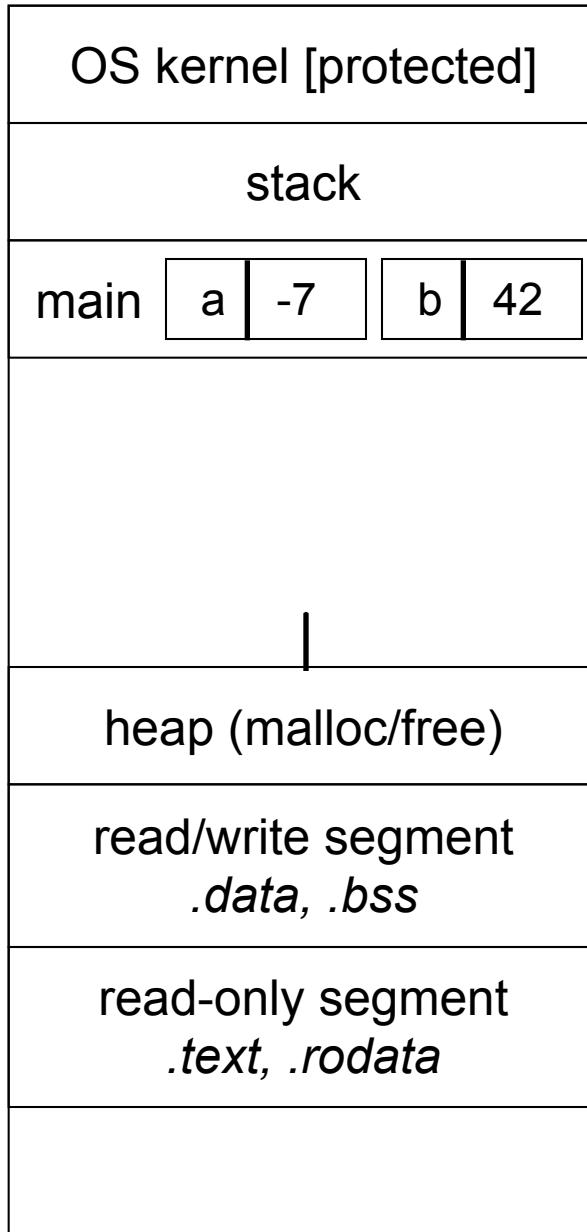

```
void swap(int *a, int *b) {
    int tmp = *a;
    *a = *b;
    *b = tmp;
}

int main(int argc, char **argv) {
    int a = 42, b = -7;

    swap(&a, &b);
    printf("a: %d, b: %d\n", a, b);
    return 0;
}
```

swap.c

Pass-by-reference (stack)

```
void swap(int *a, int *b) {  
    int tmp = *a;  
    *a = *b;  
    *b = tmp;  
}  
  
int main(int argc, char **argv) {  
    int a = 42, b = -7;  
  
    swap(&a, &b);  
    printf("a: %d, b: %d\n", a, b);  
    return 0;  
}
```

swap.c

Arrays and pointers

a pointer can point to an array element

an array's name can be used as a pointer to its first element

and, you can use `[]` notation to treat a pointer like an array

pointer[i] is *i* elements' worth of bytes forward from pointer

```
int a[5] = {10, 20, 30, 40, 50};  
int* p1 = &a[3];    // refers to a's fourth element  
int* p2 = &a[0];    // refers to a's first element  
int* p3 = a;        // refers to a's first element  
  
*p1 = 100;  
*p2 = 200;  
p1[1] = 300;  
p2[1] = 400;  
p3[2] = 500;      // final: 200, 400, 500, 100, 300
```

Passing arrays as parameters

array parameters are really passed as pointers to the first array element

the `[]` syntax for parameter types is just for convenience

```
void f(int a[]);  
  
int main(...){  
    int a[5];  
    ...  
    f(a);  
    return 0;  
}  
  
void f(int a[]){
```

your code

```
void f(int *a);  
  
int main(...){  
    int a[5];  
    ...  
    f(&a[0]);  
    return 0;  
}  
  
void f(int *a) {
```

equivalent to

Self-Exercise 1

Use a box-and-arrow diagram for the following program to explain what it prints out:

```
#include <stdio.h>

int foo(int *bar, int **baz) {
    *bar = 5;
    *(bar+1) = 6;
    *baz = bar+2;
    return *((*baz)+1);
}

int main(int argc, char **argv) {
    int arr[4] = {1, 2, 3, 4};
    int *ptr;

    arr[0] = foo(&(arr[0]), &ptr);
    printf("%d %d %d %d %d\n",
           arr[0], arr[1], arr[2], arr[3], *ptr);
    return 0;
}
```

Self-Exercise 2

Write a program that prints out whether the computer it is running on is little endian or big endian.

(hint: see pointerarithmetic.c from today's lecture)

Self-Exercise 3

Write a function that:

accepts an (array of ints) and an (array length) as arguments

malloc's an (array of (int *)) of the same length

initializes each element of the newly allocated array to point to
the corresponding element in the passed-in array

returns a pointer to the newly allocated array

See you on Monday!
