

# CSE 333

## Lecture 3 - pointers, pointers, pointers

**Hal Perkins**

Department of Computer Science & Engineering  
University of Washington

# Administrivia 1

hw0 due Monday night

- Infrastructure shakedown cruise
  - ▶ clint and valgrind tools will be useful for exercises also
- Everyone should have set up a ssh key and cloned their GitLab repo by now
  - do it right after class if you haven't done it yet
  - ▶ (will give us time to fix things if there are problems — report any trouble to cse333-staff@cs)
- Repository hygiene: only put stuff in there that should be there
  - ▶ Discuss

ex2 out now, due Monday before class

Major project and midterm dates on calendar now (Midterm Fri. May 6)

# Administrivia 2

hw1 will be out this afternoon, due in 2 weeks (Thur. 4/14)

- Linked list and hash table implementations in C
- Get the starter code by doing a “git pull” in your course repo
  - ▶ Might be some issues if your local copy has unpushed changes
    - See the CSE 333 Git Tutorial for tips
    - If Git decides you need to do a merge it might drop you into vi(m)
    - To escape: :q, or :wq if you make any changes, but default is fine
    - Set your EDITOR environment variable if you want something other than vim

# Administrivia 3

## Exercise grading

- Will do our best to keep up
- Some things to watch for (based on ex0):
  - ▶ No input sanity check (i.e., in ex0 there should be an argument, it should be an int)
  - ▶ Single blob of code, no functions
  - ▶ Formatting funnies (tabs, not spaces) - likely just a warning this time
    - Suggestion: now that you have `clint.py`, use it to check exercises
- Coding question: why compute  $x^y$  to alternate  $+-+-+-\dots$ ?

# Administrivia 4

## Documentation vs Folklore

- Documentation: man pages; books; reference web sites like cplusplus.com, man7.org; ...
- Folklore: google, stackoverflow, the person down the hall

## Tradeoffs, relative strengths/weaknesses

- Discuss

# Agenda

Today's goals:

- pointers
- more pointers
- pointers and call-by-reference
- arrays and pointers

# & and \*

*&foo* // virtual address of foo - “address of”  
*\*pointer* // dereference a pointer  
*\*pointer = value;* // dereference / assign

deref.c

```
int x = 42;
int *p;           // p is a pointer to an integer
p = &x;          // p now stores the address of x

printf("x is %d\n", x);
*p = 99;
printf("x is %d\n", x);
```

# Something curious

Let's try running this program several times:

asr.c

```
#include <stdio.h>

int main(int argc, char **argv) {
    int x = 1;
    int *p = &x;

    printf("&x: %p;  p: %p;  &p: %p\n",
           &x, p, &p);
    return 0;
}
```

```
[bash]$ ./asr
&x: 0xbfa521dc;  p: 0xbfa521dc;  &p: 0xbfa521d8
[bash]$ ./asr
&x: 0xbf836f5c;  p: 0xbf836f5c;  &p: 0xbf836f58
[bash]$ ./asr
&x: 0xbfea39dc;  p: 0xbfea39dc;  &p: 0xbfea39d8
```

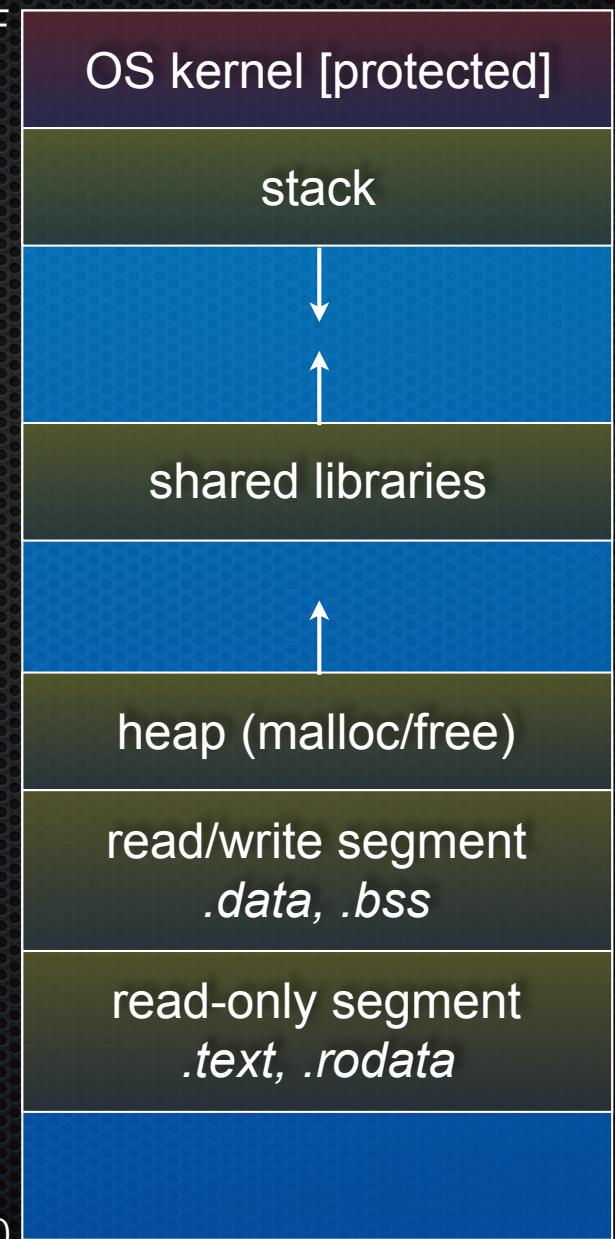

# ASR

Linux uses address-space randomization for added security

- linux randomizes:
  - ▶ base of stack
  - ▶ shared library (mmap) location
- makes stack-based buffer overflow attacks tougher
- makes debugging tougher
- google “disable linux address space randomization”

0xFFFFFFFF

0x00000000

# Box and arrow diagrams

boxarrow.c

```
int main(int argc, char **argv) {
    int x = 1;
    int arr[3] = {2, 3, 4};
    int *p = &arr[1];

    printf("&x: %p;  x: %d\n", &x, x);
    printf("&arr[0]: %p;  arr[0]: %d\n", &arr[0], arr[0]);
    printf("&arr[2]: %p;  arr[2]: %d\n", &arr[2], arr[2]);

# Pointer arithmetic

Pointers are typed

- `int *int_ptr;` vs. `char *char_ptr;`
- pointer arithmetic obeys those types
- see *pointerarithmetic.c*

```

#include <stdio.h>

int main(int argc, char **argv) {
    int arr[3] = {1, 2, 3};
    int *int_ptr = &arr[0];
    char *char_ptr = (char *) int_ptr;

    printf("int_ptr: %p;  *int_ptr: %d\n",
           int_ptr, *int_ptr);
    int_ptr += 1;
    printf("int_ptr: %p;  *int_ptr: %d\n",
           int_ptr, *int_ptr);
    int_ptr += 2; // uh oh
    printf("int_ptr: %p;  *int_ptr: %d\n",
           int_ptr, *int_ptr);

    printf("char_ptr: %p;  *char_ptr: %d\n",
           char_ptr, *char_ptr);
    char_ptr += 1;
    printf("char_ptr: %p;  *char_ptr: %d\n",
           char_ptr, *char_ptr);
    char_ptr += 2;
    printf("char_ptr: %p;  *char_ptr: %d\n",
           char_ptr, *char_ptr);

    return 0;
}

```

pointerarithmetic.c

0xFFFFFFFF

```

#include <stdio.h>

int main(int argc, char **argv) {
    int arr[3] = {1, 2, 3};
    int *int_ptr = &arr[0];
    char *char_ptr = (char *) int_ptr;

    printf("int_ptr: %p;  *int_ptr: %d\n",
           int_ptr, *int_ptr);
    int_ptr += 1;
    printf("int_ptr: %p;  *int_ptr: %d\n",
           int_ptr, *int_ptr);
    int_ptr += 2; // uh oh
    printf("int_ptr: %p;  *int_ptr: %d\n",
           int_ptr, *int_ptr);

    printf("char_ptr: %p;  *char_ptr: %d\n",
           char_ptr, *char_ptr);
    char_ptr += 1;
    printf("char_ptr: %p;  *char_ptr: %d\n",
           char_ptr, *char_ptr);
    char_ptr += 2;

brokenswap.c

# Pass-by-reference

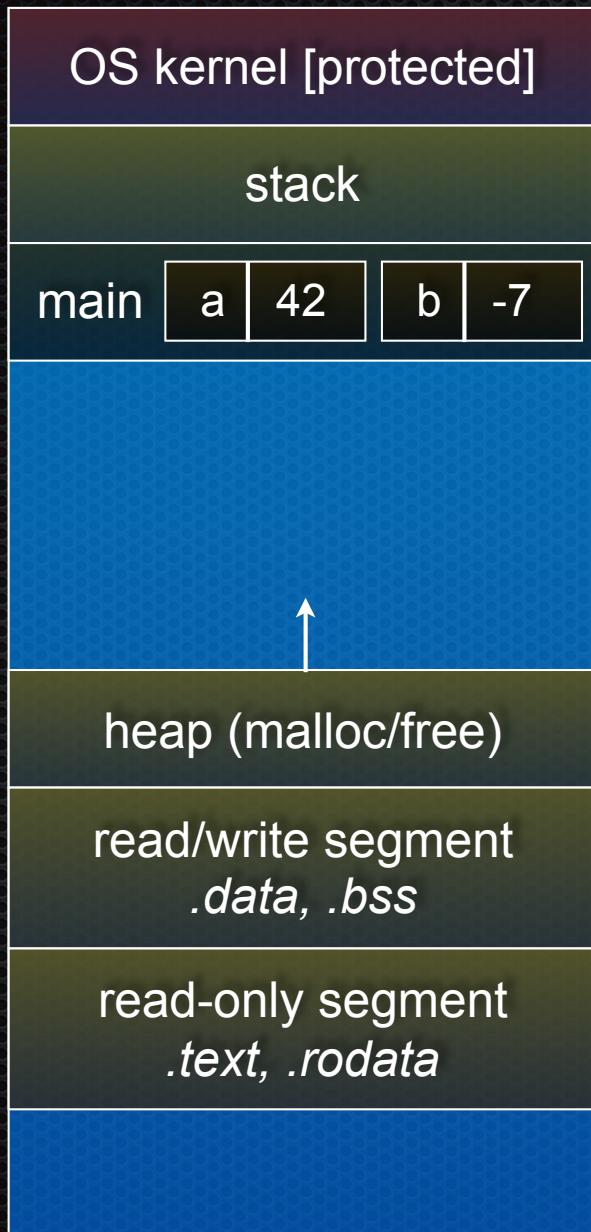

You can use pointers to pass by **reference**

- callee still receives a **copy** of the argument
  - ▶ but, the argument is a pointer
    - (so it's really call-by-value, but the value is a pointer)
  - ▶ the pointer's value points-to the variable in the scope of the caller
- this gives the callee a way to modify a variable that's in the scope of the caller

```
void swap(int *a, int *b) {  
    int tmp = *a;  
    *a = *b;  
    *b = tmp;  
}  
  
int main(int argc, char **argv) {  
    int a = 42, b = -7;  
  
    swap(&a, &b);  
    printf("a: %d, b: %d\n", a, b);  
    return 0;  
}
```

swap.c

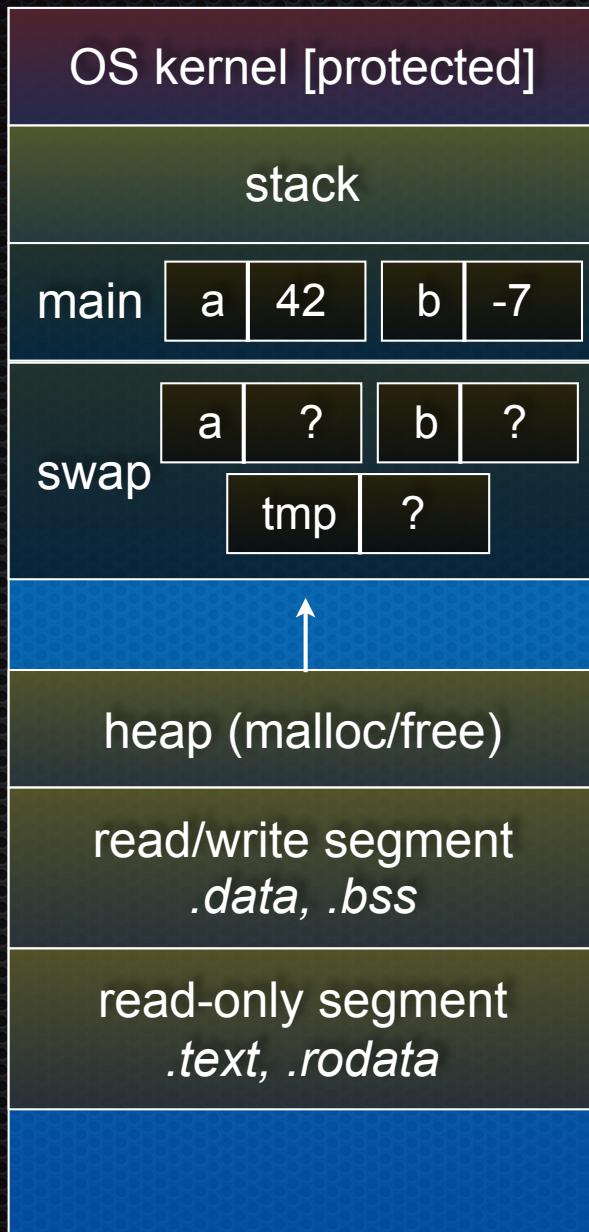

# Pass-by-reference (stack)

```
void swap(int *a, int *b) {  
    int tmp = *a;  
    *a = *b;  
    *b = tmp;  
}  
  
int main(int argc, char **argv) {  
    int a = 42, b = -7;  
  
    swap(&a, &b);  
    printf("a: %d, b: %d\n", a, b);  
    return 0;  
}
```

swap.c

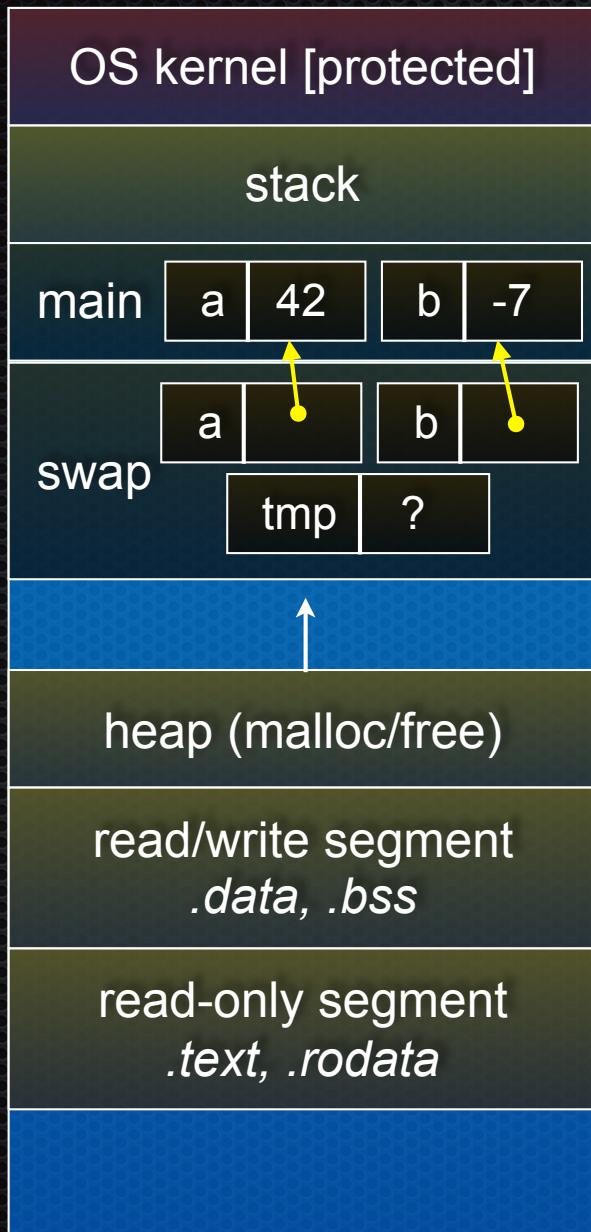

# Pass-by-reference (stack)

```
void swap(int *a, int *b) {  
    int tmp = *a;  
    *a = *b;  
    *b = tmp;  
}  
  
int main(int argc, char **argv) {  
    int a = 42, b = -7;  
  
    swap(&a, &b);  
    printf("a: %d, b: %d\n", a, b);  
    return 0;  
}
```

    printf("a: %d, b: %d\n", a, b);  
    return 0;  
}
```

swap.c

# Arrays and pointers

a pointer can point to an array element

- an array's name can be used as a pointer to its first element
- and, you can use **[]** notation to treat a pointer like an array
  - **pointer[i]** is **i** elements' worth of bytes forward from pointer

```
int a[5] = {10, 20, 30, 40, 50};  
int* p1 = &a[3];    // refers to a's fourth element  
int* p2 = &a[0];    // refers to a's first element  
int* p3 = a;        // refers to a's first element  
  
*p1 = 100;  
*p2 = 200;  
p1[1] = 300;  
p2[1] = 400;  
p3[2] = 500;      // final: 200, 400, 500, 100, 300
```

# Passing arrays as parameters

array parameters are really passed as pointers to the first array element

- the **[ ]** syntax for parameter types is just for convenience

```
void f(int a[]);  
  
int main(...){  
    int a[5];  
    ...  
    f(a);  
    return 0;  
}  
  
void f(int a[]){
```

your code

```
void f(int *a);  
  
int main(...){  
    int a[5];  
    ...  
    f(&a[0]);  
    return 0;  
}  
  
void f(int *a) {
```

equivalent to

# Self-Exercise 1

Use a box-and-arrow diagram for the following program to explain what it prints out:

```
#include <stdio.h>

int foo(int *bar, int **baz) {
    *bar = 5;
    *(bar+1) = 6;
    *baz = bar+2;
    return *((*baz)+1);
}

int main(int argc, char **argv) {
    int arr[4] = {1, 2, 3, 4};
    int *ptr;

    arr[0] = foo(&(arr[0]), &ptr);
    printf("%d %d %d %d %d\n",
           arr[0], arr[1], arr[2], arr[3], *ptr);
    return 0;
}
```

# Self-Exercise 2

Write a program that prints out whether the computer it is running on is little endian or big endian.

- (hint: see pointerarithmetic.c from today's lecture)

# Self-Exercise 3

Write a function that:

- accepts an (array of ints) and an (array length) as arguments
- malloc's an (array of (int \*)) of the same length
- initializes each element of the newly allocated array to point to the corresponding element in the passed-in array
- returns a pointer to the newly allocated array

See you on Monday!
