# Hypertext Transport Protocol

## CSE 333 Summer 2018

**Instructor:** Hal Perkins

**Teaching Assistants:**

Renshu Gu William Kim Soumya Vasisht

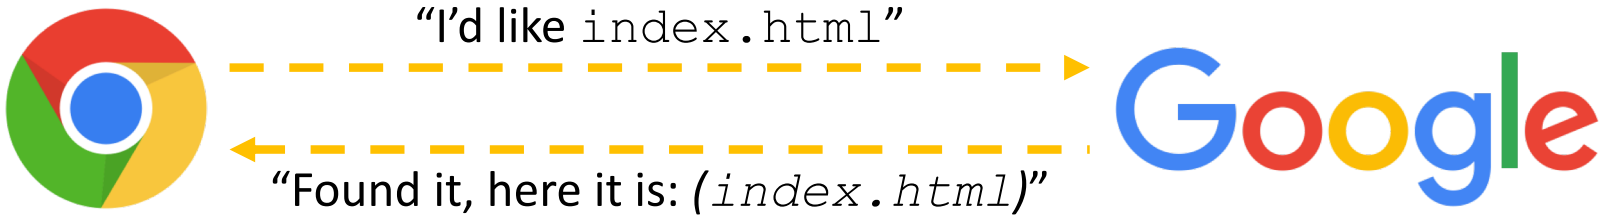
# Administrivia

- Section tomorrow: `pthread` tutorial/demo
  - Followup exercise posted after section, due beginning of next week
  - Much more about concurrency in remaining summer lectures
    - But will not repeat section material

- hw4 due next Wednesday night

- CSE 331 guest lecture Friday, 1:10, GUG 220: Kendra Yourtee, Amazon sr. exec, on Tech Interviews, more

# HTTP Basics



- A client establishes one or more TCP connections to a server
  - The client sends a request for a web object over a connection and the server replies with the object's contents
- We have to figure out how to let the client and server communicate their intentions to each other clearly
  - We have to define a *protocol*

# Protocols

- A protocol is a set of rules governing the format and exchange of messages in a computing system
  - What messages can a client exchange with a server?
    - What is the syntax of a message?
    - What do the messages mean?
    - What are legal replies to a message?
  - What sequence of messages are legal?
    - How are errors conveyed?

- A protocol is (roughly) the network equivalent of an API

# HTTP

- Hypertext Transport Protocol
  - A request / response protocol
    - A client (web browser) sends a request to a web server
    - The server processes the request and sends a response
  - Typically, a **request** asks a server to retrieve a resource
    - A *resource* is an object or document, named by a Uniform Resource Identifier (**URI**)
  - A **response** indicates whether or not the server succeeded
    - If so, it provides the content of the requested response
  - Wikipedia: https://en.wikipedia.org/wiki/Hypertext_Transfer_Protocol

# HTTP Requests

- General form:
  - `[METHOD] [request-uri] HTTP/[version]\r\n`
    `[headerfield1]: [fieldvalue1]\r\n`
    `[headerfield2]: [fieldvalue2]\r\n`
    `[...]`
    `[headerfieldN]: [fieldvalueN]\r\n`
    `\r\n`
    `[request body, if any]`

- Demo: use nc to see a real request

# HTTP Methods

- There are three commonly-used HTTP methods:
  - `GET`: "please send me the named resource"
  - `POST`: "I'd like to submit data to you" (*e.g.* file upload)
  - `HEAD`: "Send me the headers for the named resource"
    - Doesn't send resource; often to check if cached copy is still valid

- Other methods exist, but are much less common:
  - `PUT`, `DELETE`, `TRACE`, `OPTIONS`, `CONNECT`, `PATCH`, `...`
    - For instance: `TRACE` – "show any proxies or caches in between me and the server"

# HTTP Versions

- All current browsers and servers "speak" HTTP/1.1
  - Version 1.1 of the HTTP protocol
    - https://www.w3.org/Protocols/rfc2616/rfc2616.html
  - Standardized in 1997 and meant to fix shortcomings of HTTP/1.0
    - Better performance, richer caching features, better support for multihomed servers, and much more

- HTTP/2 standardized recently (published in 2015)
  - Allows for higher performance but doesn't change the basic web request/response model
  - Will coexist with HTTP/1.1 for a long time

# Client Headers

- The client can provide zero or more request "headers"
  - These provide information to the server or modify how the server should process the request

- You'll encounter many in practice
  - `Host:` the DNS name of the server
  - `User-Agent:` an identifying string naming the browser
  - `Accept:` the content types the client prefers or can accept
  - `Cookie:` an HTTP cookie previously set by the server
  - https://www.w3.org/Protocols/rfc2616/rfc2616-sec5.html

# A Real Request

```
GET / HTTP/1.1
Host: attu.cs.washington.edu:3333
Connection: keep-alive
Upgrade-Insecure-Requests: 1
User-Agent: Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36
(KHTML, like Gecko) Chrome/66.0.3359.181 Safari/537.36
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,image/webp,
image/apng,*/*;q=0.8
DNT: 1
Accept-Encoding: gzip, deflate
Accept-Language: en-US,en;q=0.9
Cookie: SESS0c8e598bbe17200b27e1d0a18f9a42bb=5c18d7ed6d369d56b69a1c0aa441d7

...
```

# HTTP Responses

- General form:
  - `HTTP/[version] [status code] [reason]\r\n`
    `[headerfield1]: [fieldvalue1]\r\n`
    `[headerfield2]: [fieldvalue2]\r\n`
    `[...]`
    `[headerfieldN]: [fieldvalueN]\r\n`
    `\r\n`
    `[response body, if any]`

- Demo: use telnet to see a real response

# Status Codes and Reason

- *Code*: numeric outcome of the request – easy for computers to interpret
  - A 3-digit integer with the 1st digit indicating a response category
    - `1xx`: Informational message
    - `2xx`: Success
    - `3xx`: Redirect to a different URL
    - `4xx`: Error in the client's request
    - `5xx`: Error experienced by the server

- *Reason*: human-readable explanation
  - *e.g.* "OK" or "Moved Temporarily"

# Common Statuses

- `HTTP/1.1 200 OK`
  - The request succeeded and the requested object is sent
- `HTTP/1.1 404 Not Found`
  - The requested object was not found
- `HTTP/1.1 301 Moved Permanently`
  - The object exists, but its name has changed
    - The new URL is given as the "`Location:`" header value
- `HTTP/1.1 500 Server Error`
  - The server had some kind of unexpected error

# Server Headers

- The server can provide zero or more response "headers"
  - These provide information to the client or modify how the client should process the response

- You'll encounter many in practice
  - `Server:` a string identifying the server software
  - `Content-Type:` the type of the requested object
  - `Content-Length:` size of requested object
  - `Last-Modified:` a date indicating the last time the request object was modified
  - https://www.w3.org/Protocols/rfc2616/rfc2616-sec6.html

# A Real Response

```
HTTP/1.1 200 OK
Date: Mon, 21 May 2018 07:58:46 GMT
Server: Apache/2.2.32 (Unix) mod_ssl/2.2.32 OpenSSL/1.0.1e-fips
mod_pubcookie/3.3.4a mod_uwa/3.2.1 Phusion_Passenger/3.0.11
Last-Modified: Mon, 21 May 2018 07:58:05 GMT
ETag: "2299e1ef-52-56cb2a9615625"
Accept-Ranges: bytes
Content-Length: 82
Vary: Accept-Encoding,User-Agent
Connection: close
Content-Type: text/html

</body></html>
```

# Cool HTTP/1.1 Features

- "Chunked Transfer-Encoding"
  - A server might not know how big a response object is
    - *e.g.* dynamically-generated content in response to a query or other user input
  - How do you sent Content-Length?
    - Could wait until you've finished generating the response, but that's not great in terms of *latency* – we want to start sending the response right away
  - Chunked message body: response is a series of chunks

# Cool HTTP/1.1 Features

- Persistent connections
  - Establishing a TCP connection is costly
    - Multiple network round trips to set up the TCP connection
    - TCP has a feature called "slow start"; slowly grows the rate at which a TCP connection transmits to avoid overwhelming networks
  - A web page consists of multiple objects and a client probably visits several pages on the same server
    - Bad idea: separate TCP connection for each object
    - Better idea: single TCP connection, multiple requests

# 20 years later…

- World has changed since HTTP/1.1 adopted
  - Web pages were a few hundred KB with a few dozen objects on each page, now several MB each with hundreds of objects (JS, graphics, …) & multiple domains per page
  - Much larger ecosystem of devices (phones especially)
  - Many hacks used to make HTTP/1.1 performance tolerable
    - Multiple TCP sockets from browser to server
    - Caching tricks; JS/CSS ordering and loading tricks; cookie hacks
    - Compression/image optimizations; splitting/sharding requests
    - etc., etc. …

# HTTP/2

- Based on Google SPDY; standardized in 2015
  - Binary protocol - easier parsing by machines (harder for humans); sizes in headers, not discovered as requests are processed, …
    - But same core request/response model (GET, POST, OK, …)
  - Multiple data steams multiplexed on single TCP connections
  - Header compression, server push, object priorities, more…
- All existing implementations incorporate TLS encryption (https)
- Supported by all major browsers and servers since ~2015
- Widely used now by all major web sites
  - Coexists with HTTP/1.1
  - HTTP/2 used automatically when browser and server both support it

# Extra Exercise #1

- Write a program that:
  - Creates a listening socket that accepts connections from clients
  - Reads a line of text from the client
  - Parses the line of text as a DNS name
  - Connects to that DNS name on port 80
  - Writes a valid HTTP request for "/"
    - ```
      GET / HTTP/1.1\r\n
      Host: <DNS name>\r\n
      Connection: close\r\n
      \r\n
      ```
  - Reads the reply and returns it to the client
      ```
