Introduction to Networking

CSE 333 Autumn 2019

Guest Instructor: Travis McGaha!

Teaching Assistants:

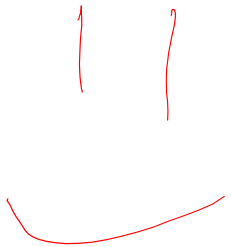
Dao Yi	Farrell Fileas	Lukas Joswiak
Nathan Lipiarski	Renshu Gu	Travis McGaha
Yibo Cao	Yifan Bai	Yifan Xu

Poll Everywhere

pollev.com/cse333

About how long did Exercise 14a take?

A. 0-1 Hours
B. 1-2 Hours
C. 2-3 Hours
D. 3-4 Hours
E. 4+ Hours
F. I prefer not to say



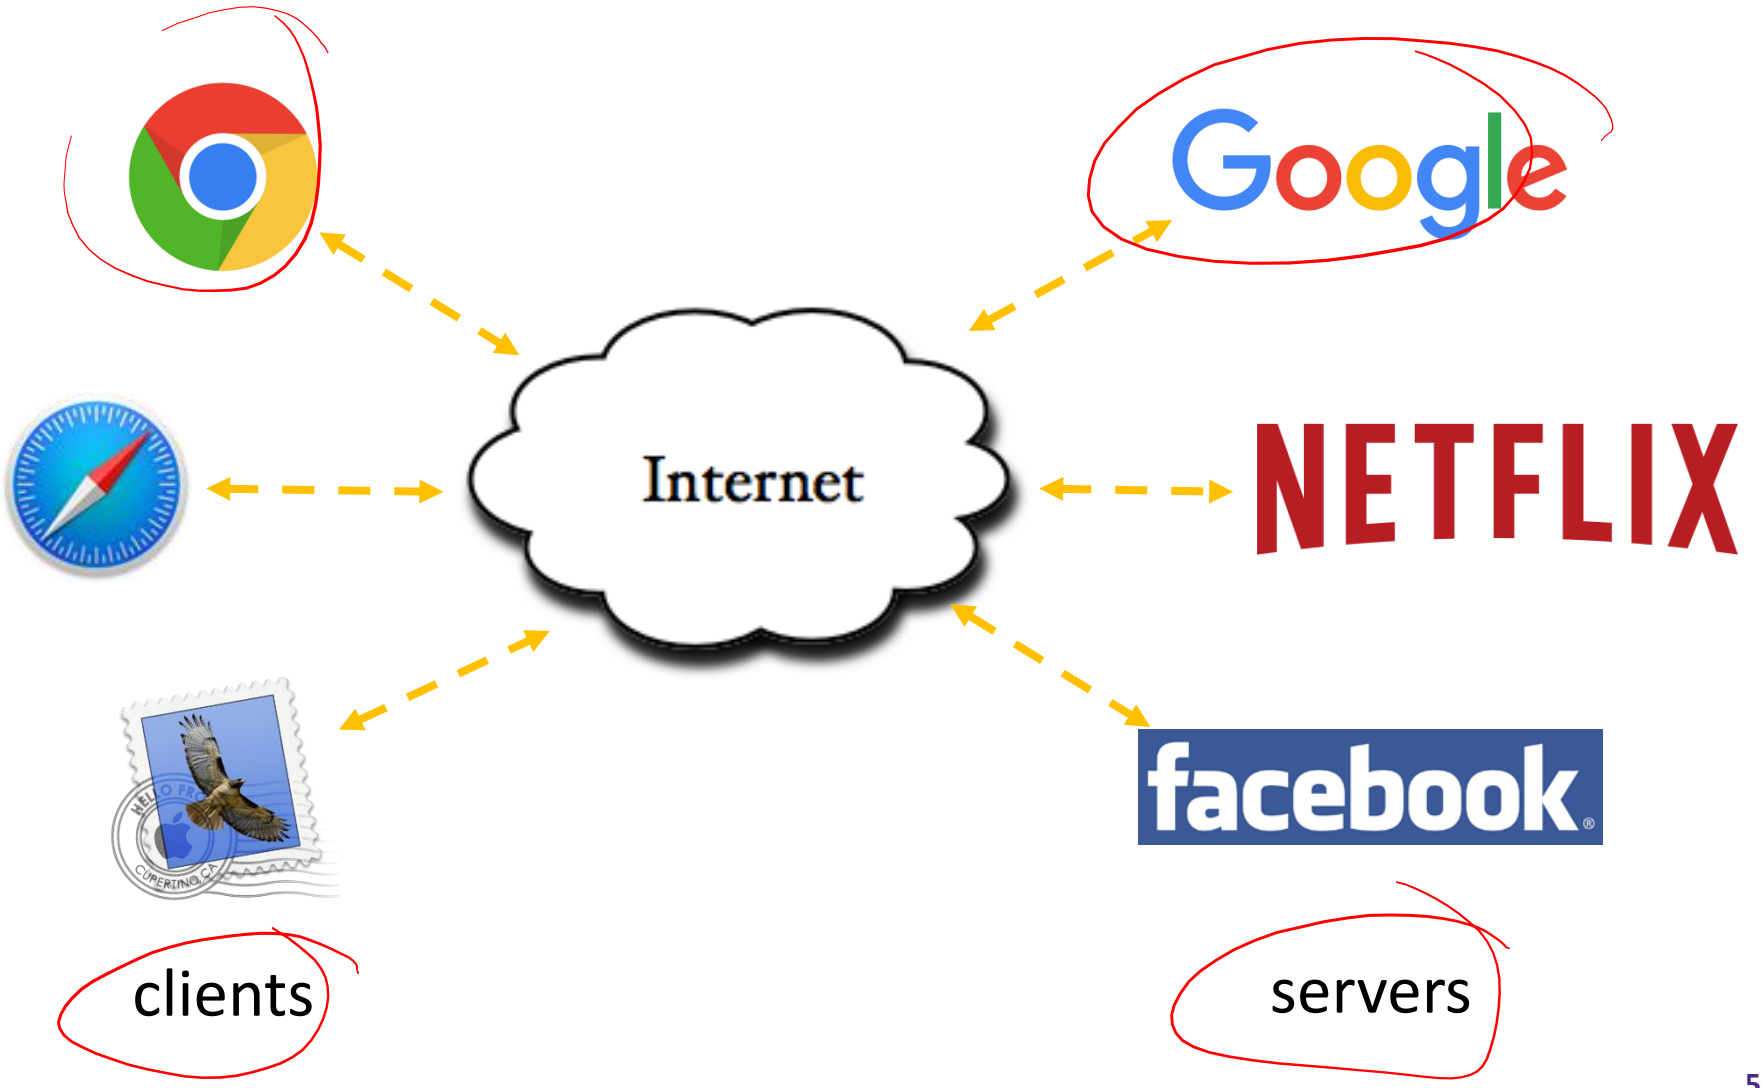
Administrivia

- Exercise 14b released today (Due 11/13)
  - Writing-only assignment (no coding!)
- HW3 due Thursday (11/14)
  - Remember to use `hw3fsck` to check your index file!
  - Using 1 late day: 8:59pm on Friday
  - Using 2 late days: 8:59pm on **Sunday**
- No School on Monday
  - Extra Office Hours Today from 3-5 pm 4th floor breakout

Lecture Outline

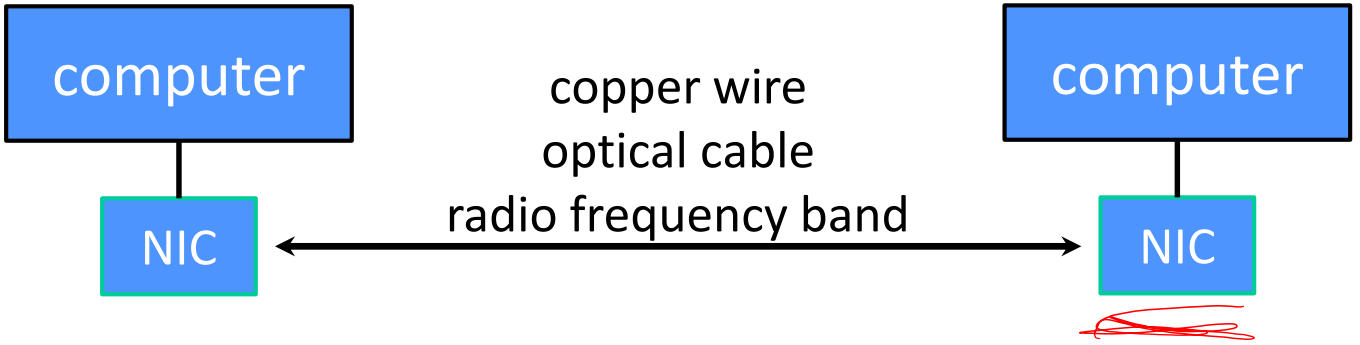
- **Introduction to Networks**
  - **Layers upon layers upon layers…**

Networks From 10,000 ft



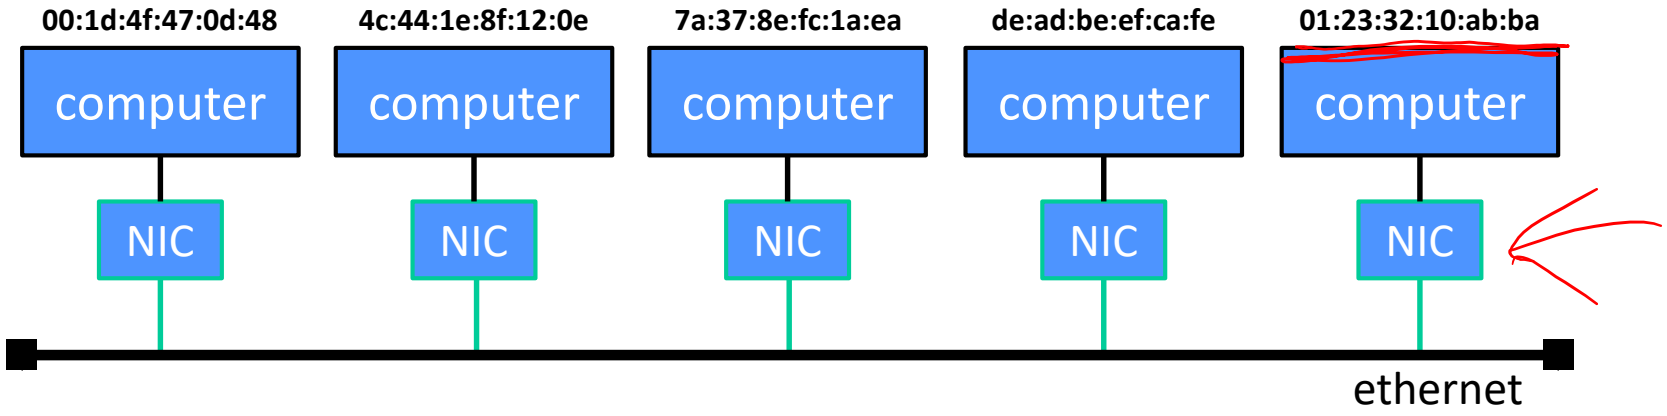
The Physical Layer

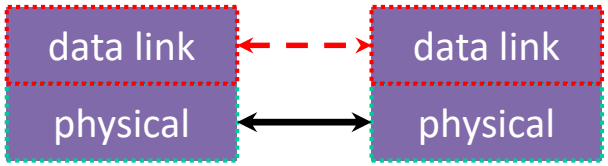
- Individual bits are modulated onto a wire or fiber optic cable, or transmitted over radio
  - Physical layer specifies how bits are encoded at a signal level
  - Many choices, e.g., encode "1" as +1v, "0" as -0v; or "0"=+1v, "1"=-1v, …

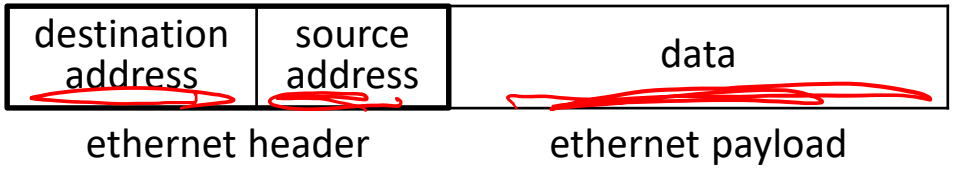


The Data Link Layer

- Multiple computers on a LAN contend for the network medium
  - Media access control (MAC) specifies how computers cooperate
  - Link layer also specifies how bits are "packetized" and network interface controllers (NICs) are addressed

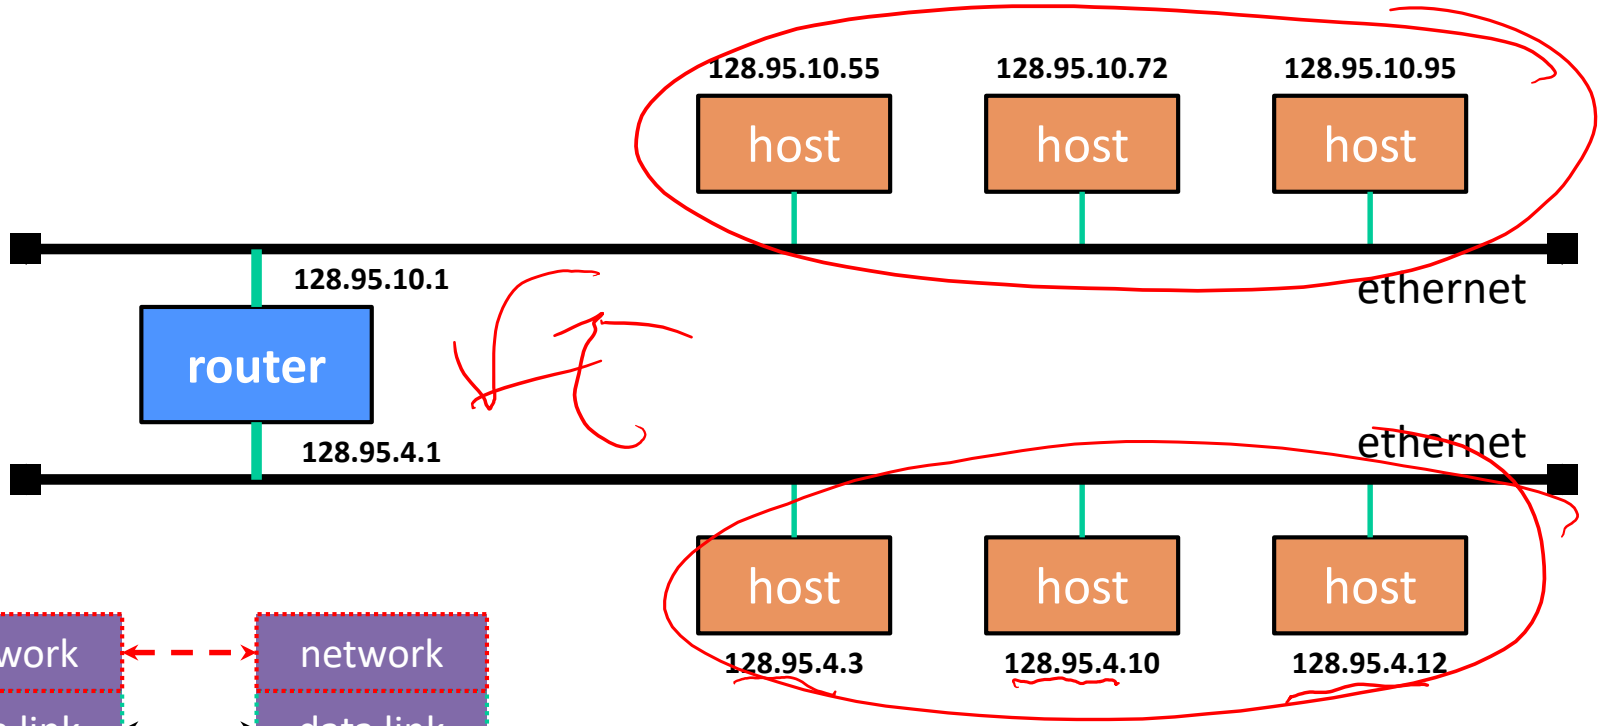


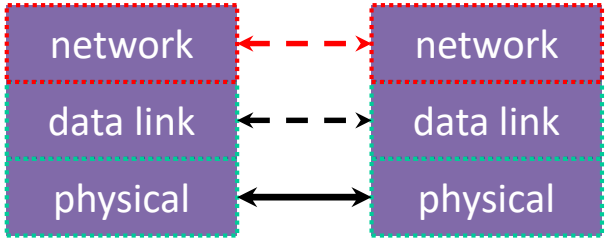




The Network Layer (IP)

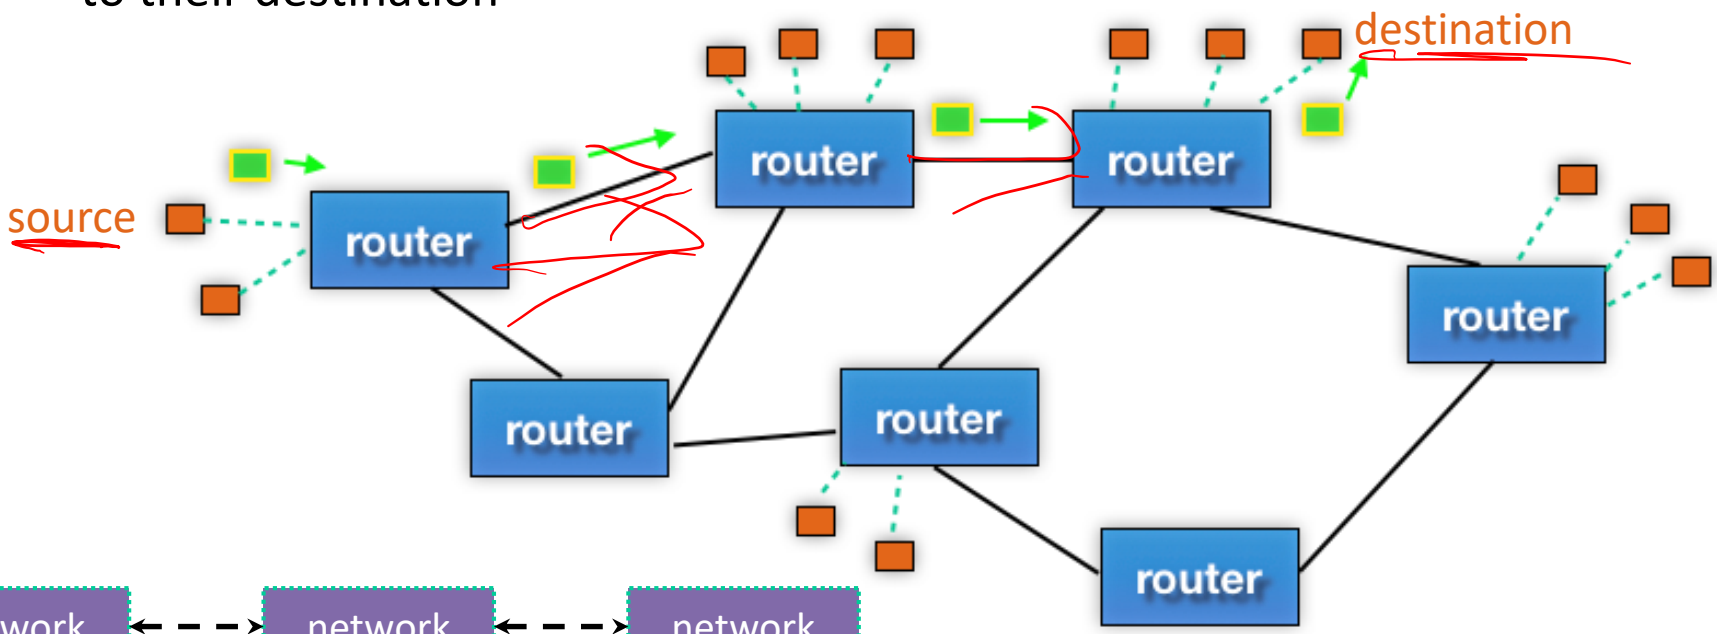
- Internet Protocol (IP) routes packets across multiple networks
  - Every computer has a unique IP address
  - Individual networks are connected by routers that span networks

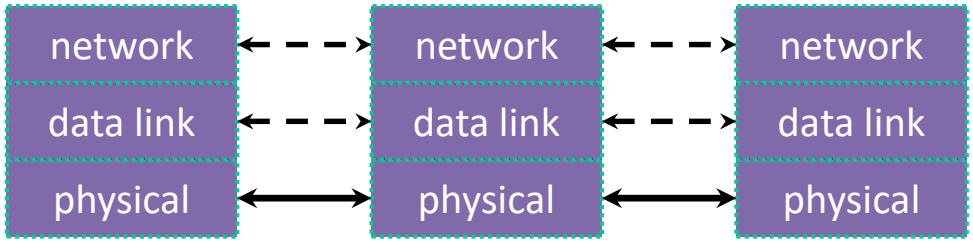




The Network Layer (IP)

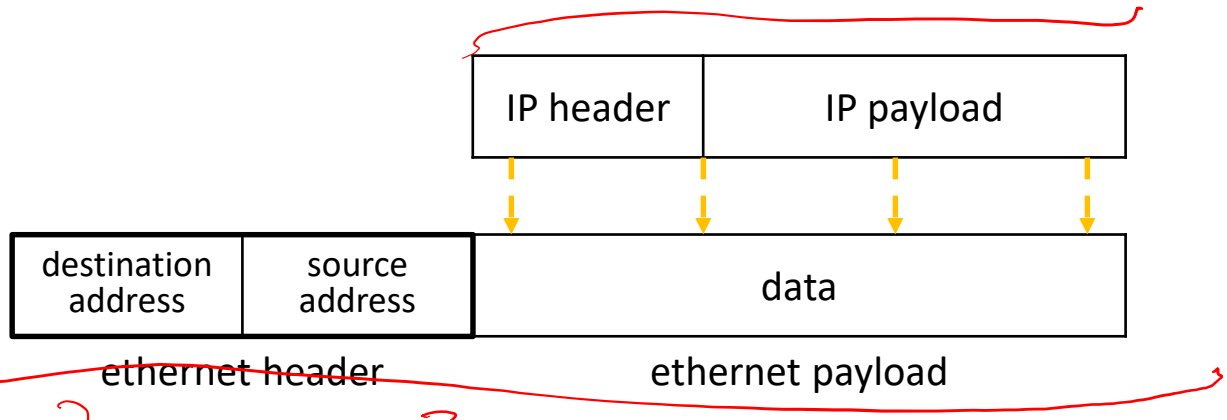
- There are protocols to:
  - Let a host map an IP to MAC address on the same network
  - Let a router learn about other routers to get IP packets one step closer to their destination





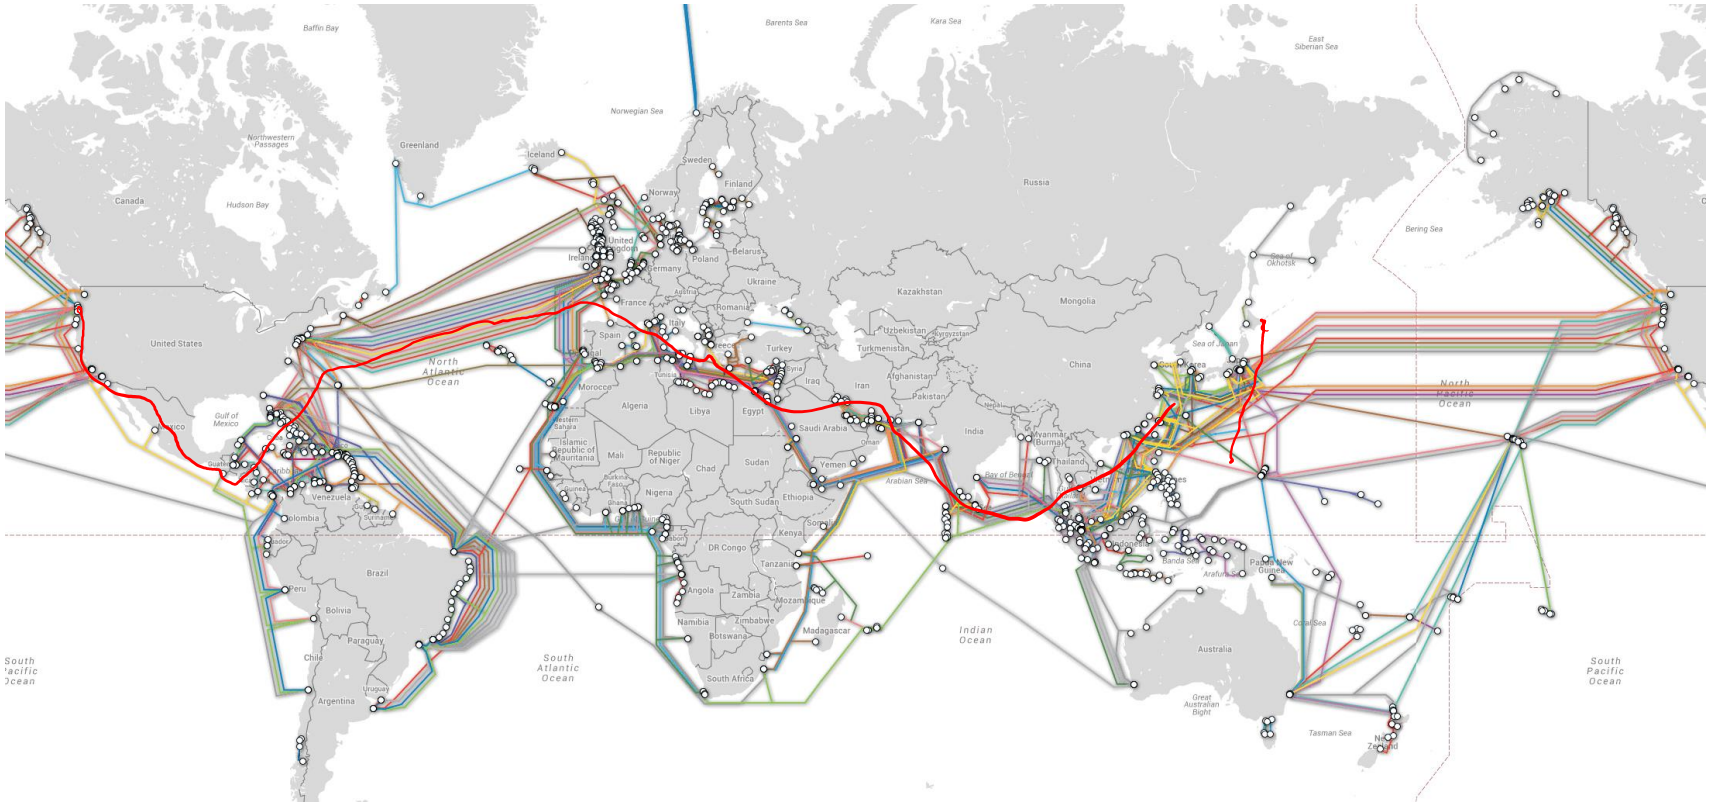
The Network Layer (IP)

- Packet encapsulation:
  - An IP packet is encapsulated as the payload of an Ethernet frame
  - As IP packets traverse networks, routers pull out the IP packet from an Ethernet frame and plunk it into a new one on the next network



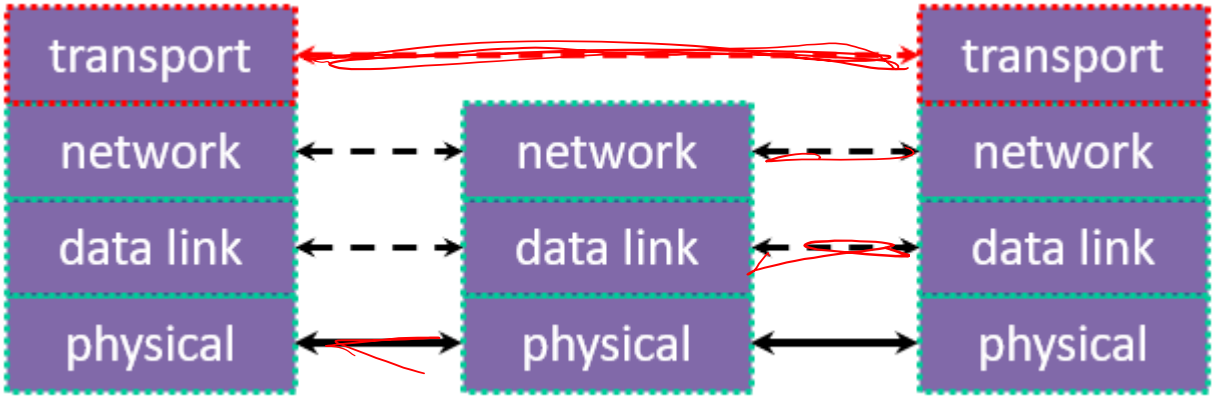
Reliability

- Packet loss?
- Physical Layer interference?
- Link going down?



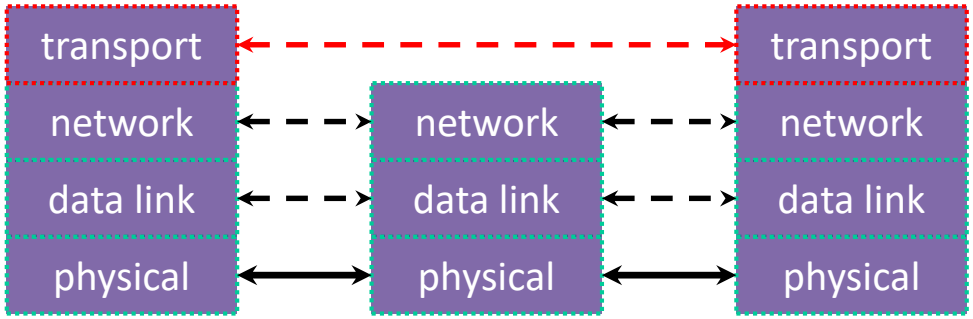
The Transport Layer

- Provides an interface to treat the network as a data stream
- Provides different protocols to interface between source and destination:
  - TCP - Transmission Control Protocol
  - UDP - User Datagram Protocol
- These protocols still work with packets, but manages their order, reliability, multiple applications using the network…



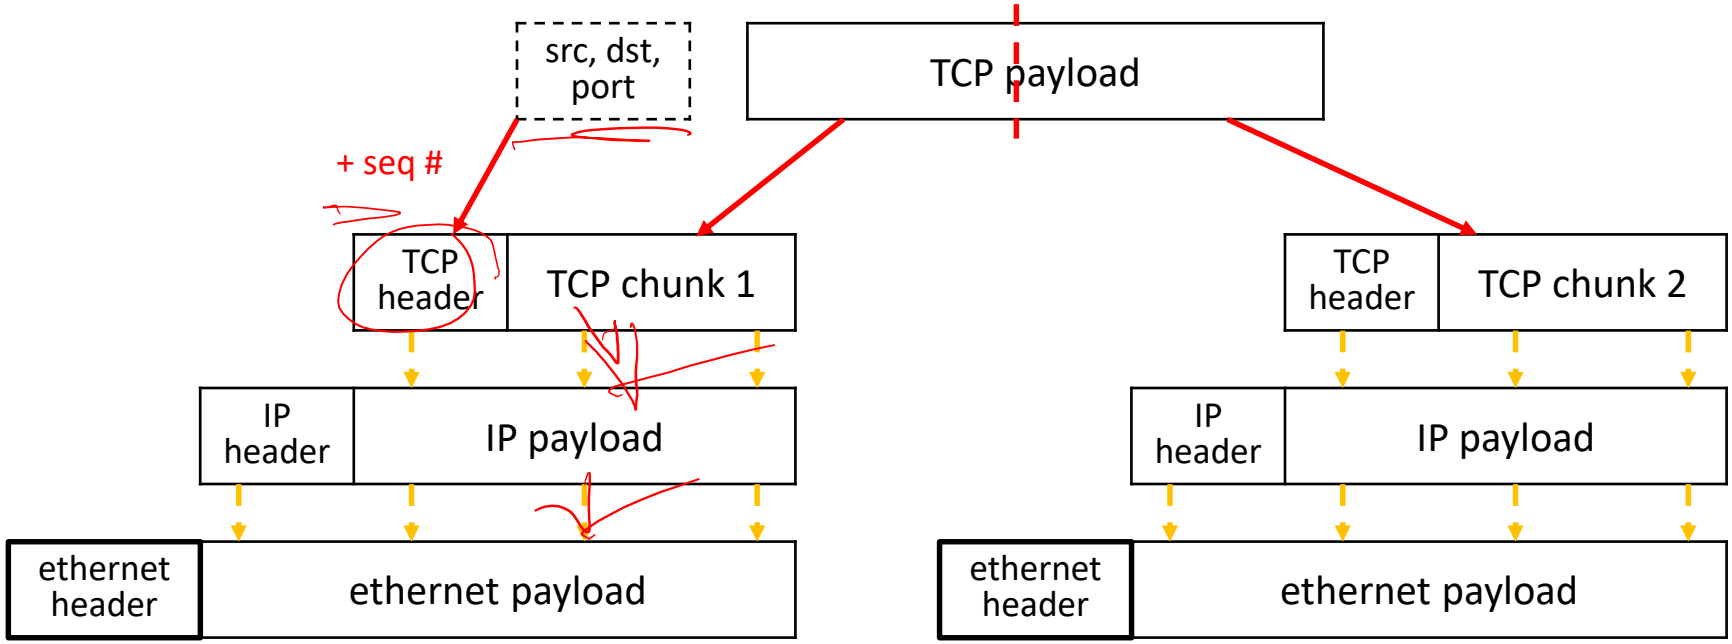
The Transport Layer (TCP)

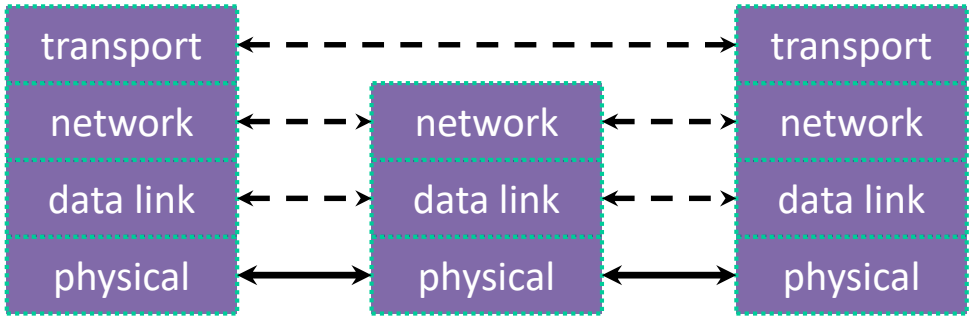
- Transmission Control Protocol (TCP):
  - Provides applications with reliable, ordered, congestion-controlled byte streams
    - Sends stream data as multiple IP packets (differentiated by sequence numbers) and retransmits them as necessary
    - When receiving, puts packets back in order and detects missing packets
  - A single host (IP address) can have up to 2^{16} = 65,535 "ports"
    - Kind of like an apartment number at a postal address (your applications are the residents who get mail sent to an apt. #)



The Transport Layer (TCP)

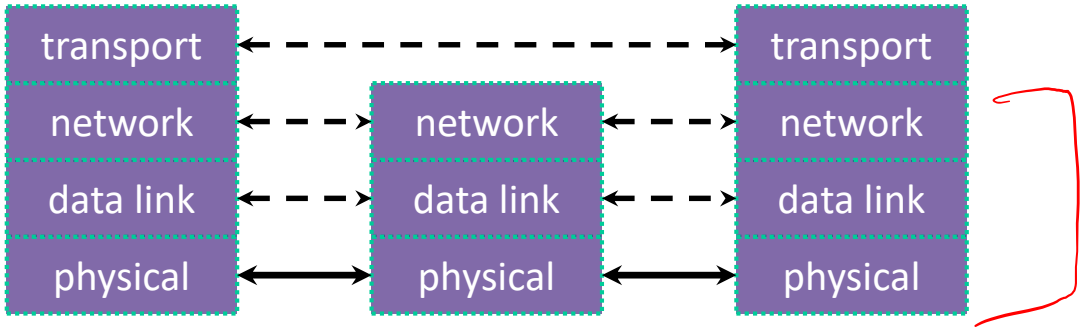
- Packet encapsulation – one more nested layer!





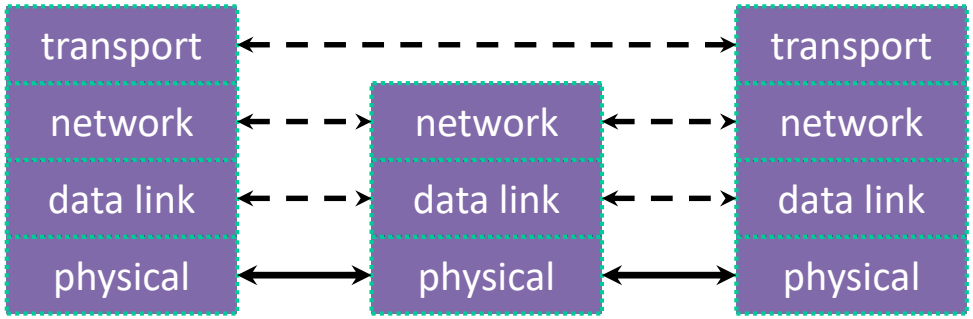
The Transport Layer (TCP)

- Applications use OS services to establish TCP streams:
  - The "Berkeley sockets" API
    - A set of OS system calls
  - Clients `connect()` to a server IP address + application port number
  - Servers `listen()` for and `accept()` client connections
  - Clients and servers `read()` and `write()` data to each other



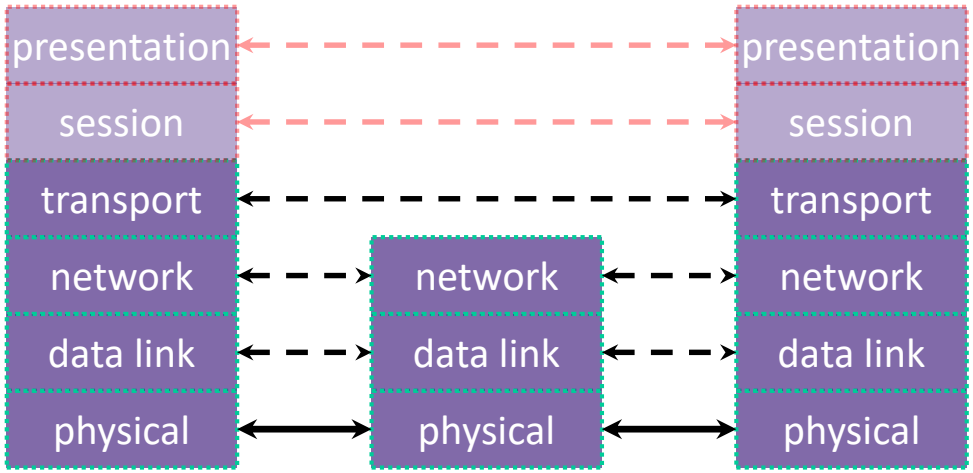
The Transport Layer (UDP)

- User Datagram Protocol (UDP):
  - Provides applications with *unreliable* packet delivery
  - UDP is a really thin, simple layer on top of IP
    - Datagrams still are fragmented into multiple IP packets



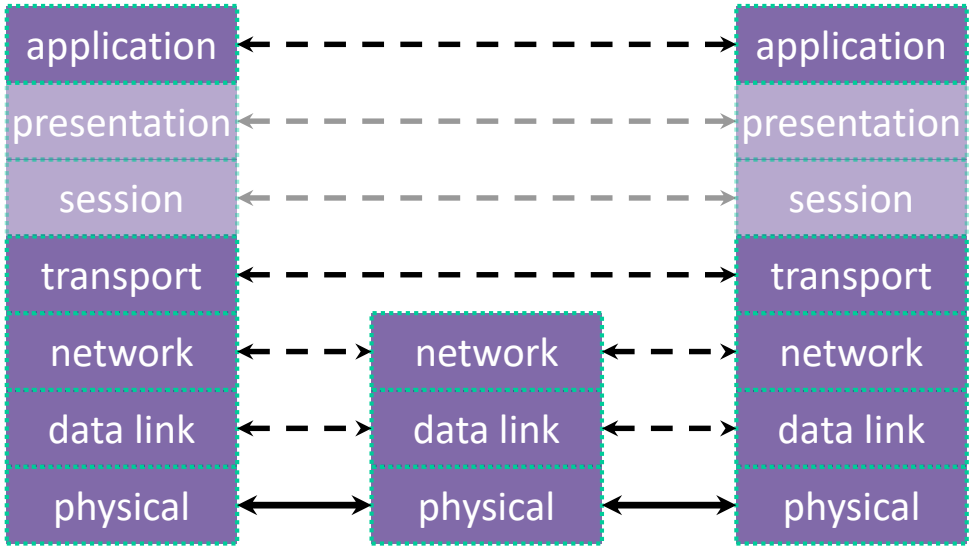
The (Mostly Missing) Layers 5 & 6

- Layer 5: Session Layer
  - Supposedly handles establishing and terminating application sessions
  - Remote Procedure Call (RPC) kind of fits in here
- Layer 6: Presentation Layer
  - Supposedly maps application-specific data units into a more network-neutral representation
  - Encryption (SSL) kind of fits in here



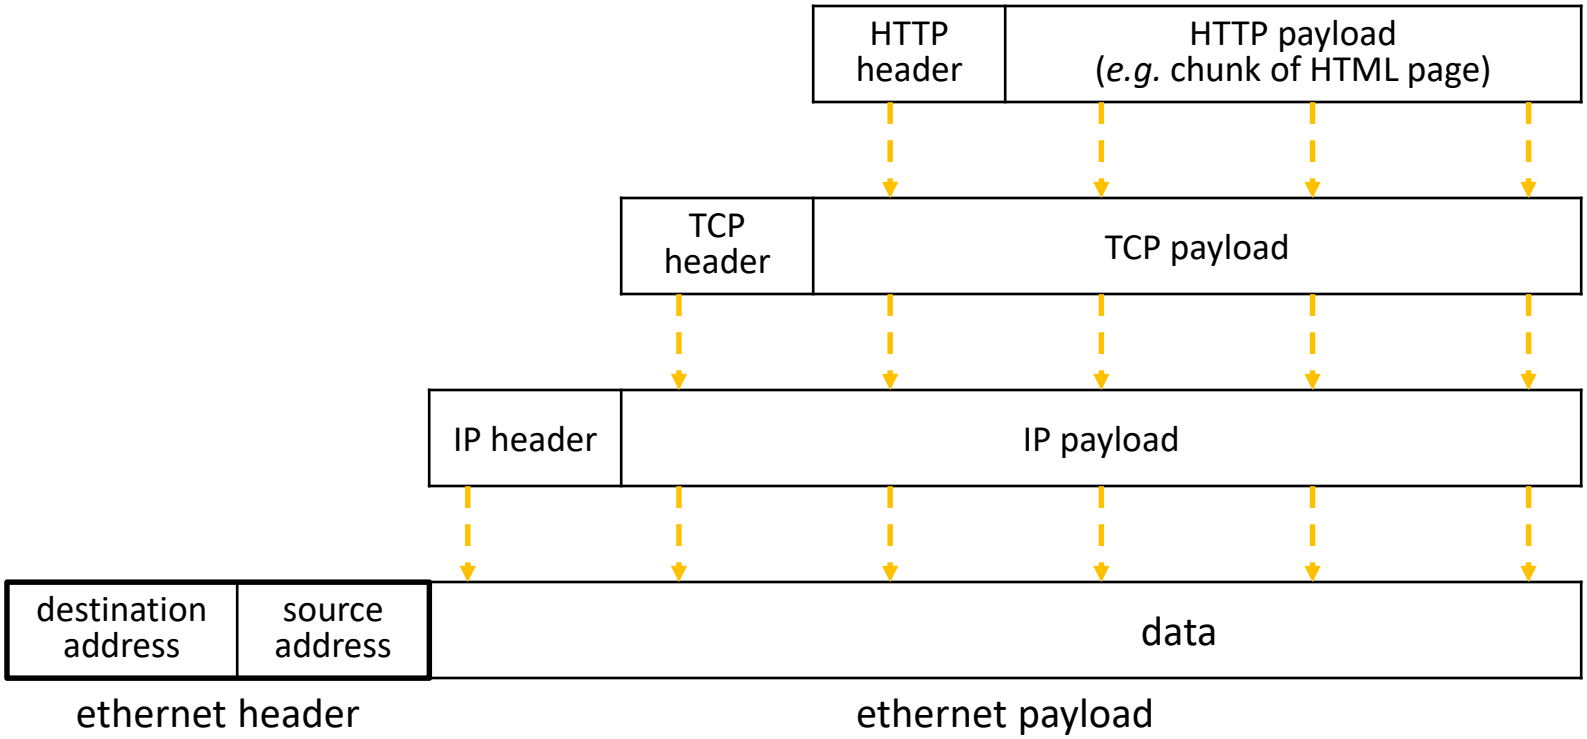
The Application Layer

- Application protocols
  - The format and meaning of messages between application entities
  - Example: HTTP is an application-level protocol that dictates how web browsers and web servers communicate
    - HTTP is implemented *on top of* TCP streams



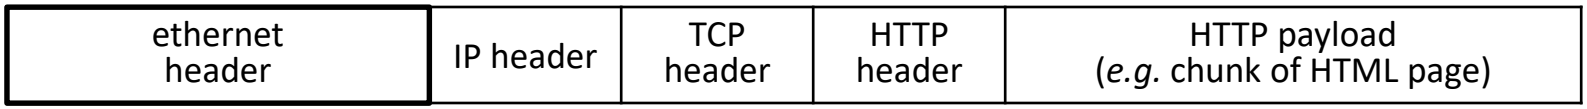
The Application Layer

- Packet encapsulation:



The Application Layer

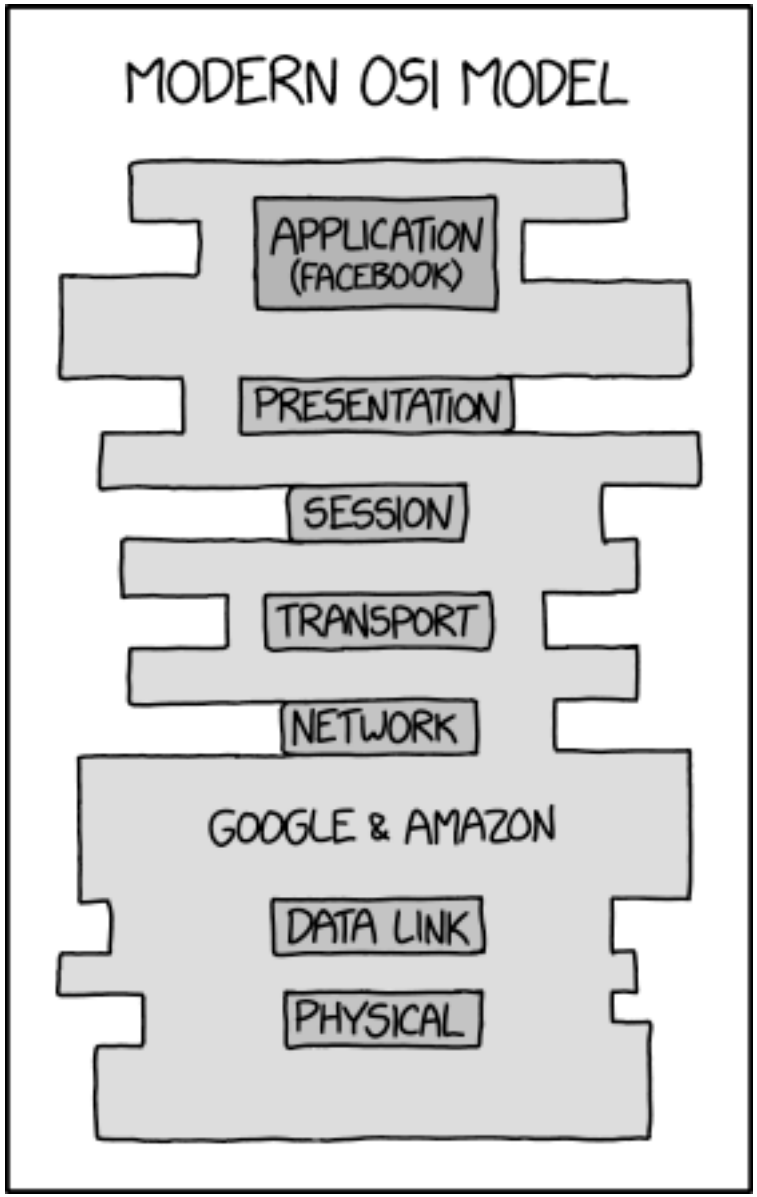
- Packet encapsulation:



The Application Layer

- Popular application-level protocols:
  - **DNS:** translates a domain name (*e.g.* www.google.com) into one or more IP addresses (*e.g.* 74.125.197.106)
    - Domain Name System
    - An hierarchy of DNS servers cooperate to do this
  - **HTTP:** web protocols
    - Hypertext Transfer Protocol
  - **SMTP, IMAP, POP:** mail delivery and access protocols
    - Secure Mail Transfer Protocol, Internet Message Access Protocol, Post Office Protocol
  - **SSH:** secure remote login protocol
    - Secure Shell
  - **bittorrent:** peer-to-peer, swarming file sharing protocol

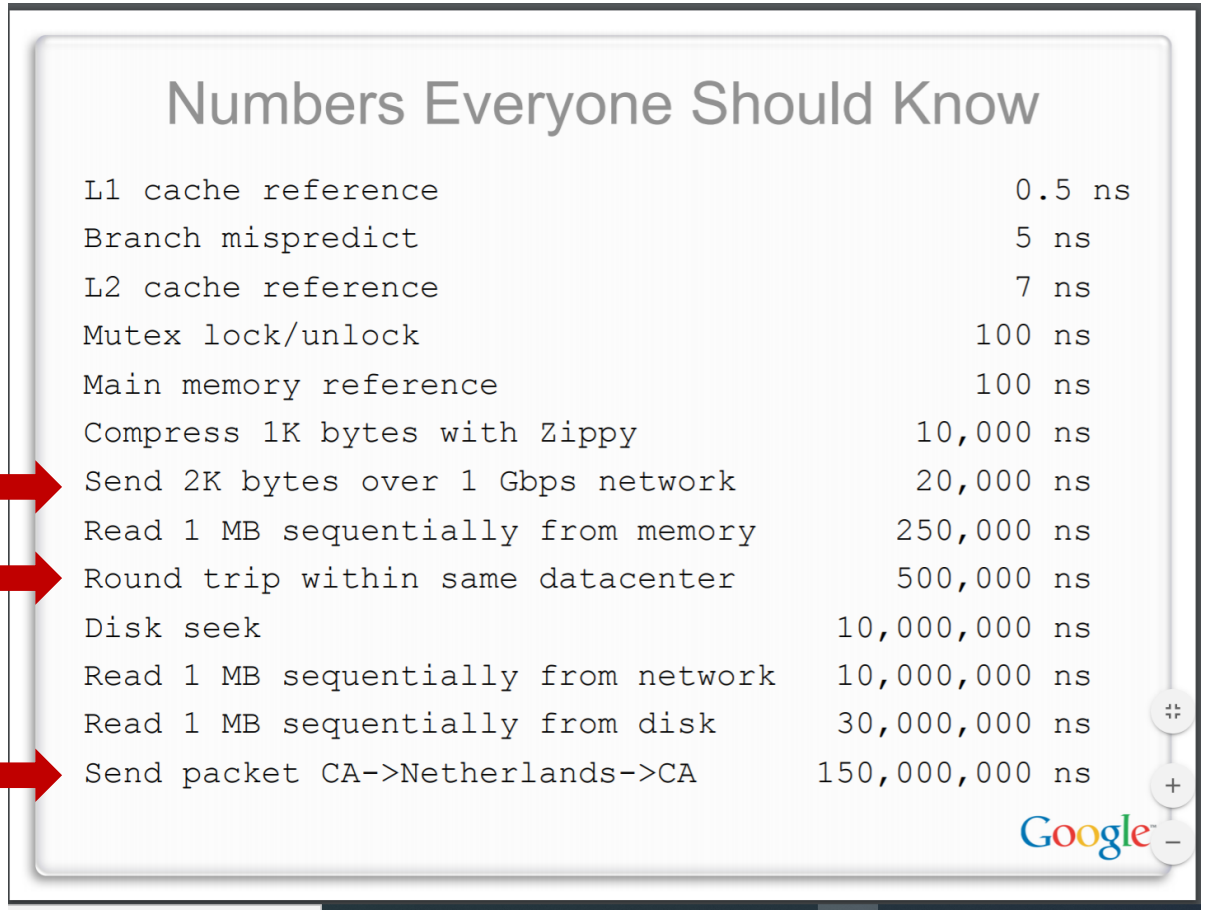
In Other Words …



https://xkcd.com/2105/

"Network" Latency is Highly Variable

- Jeff Dean's "Numbers Everyone Should Know" (LADIS '09)



Latency: Distance Matters

- Distances within a single datacenter are smaller than distances across continents
- Even within a datacenter, distances can sometimes matter

123Net Data Center, Wikimedia

Latency: Materials Matter

- Fiber optic cables are lower-latency and higher-bandwidth than traditional copper wiring
  - Much of the internet's "long haul" data is transmitted on these
  - (signal attenuation is much better too)

- Is it faster to send 1 person from UW to …
  - Downtown Seattle?
  - Downtown Ballard?

Latency: Topology Matters

- Some places are surprisingly well- or poorly-connected to "backbone" infrastructure like fiber optic cables

- Unintuitive topology creates interesting failures
  - Eg, 2006 Hengchun Earthquake disrupted communications to Singapore, Phillipines, Thailand, China, etc for a month
