

# Data Structures, Modules, and CPP

## CSE 333 Summer 2020

**Instructor:** Travis McGaha

**Teaching Assistants:**

Jeter Arellano

Ramya Challa

Kyrie Dowling

Ian Hsiao

Allen Jung

Sylvia Wang

[pollev.com/cse33320su](https://pollev.com/cse33320su)

## About how long did Exercise 3 take?

- A. 0-1 Hours
- B. 1-2 Hours
- C. 2-3 Hours
- D. 3-4 Hours
- E. 4+ Hours
- F. I didn't submit / I prefer not to say

### Additional Questions:

Thoughts on how to handle breakout rooms?  
if we add more OH, when should it be?

# Administrivia

- ❖ We read every response in the Pre-Quarter Survey
- ❖ Ed Post addressing everything later!
  - Today we have a busy lecture!
- ❖ Current Poll Everywhere is to address some of these things
- ❖ People have different preferences, can't be perfect for everyone 😞
- ❖ Some common concerns:
  - Productivity is hard:
    - You are not alone. A lot of instructors are like this, but we are here to help you get through it. Please email us if you need help. We care.
  - This class is a lot of work:
    - Yes, it is. There is a lot of material to this course, but we are trying to lessen the burden and be as available for help as possible

# Administrivia

- ❖ Exercise 3 was due this morning
  
- ❖ Exercise 4 out today, due Monday morning
  
- ❖ Exercise 5 will be based on Material covered in Section tomorrow and Lecture on Monday.
  - Due Wednesday 7/8 morning, out late tomorrow
  - Longer and harder than previous exercises. All about style, so start early!
  
- ❖ Section code “handout” for tomorrow will be added to the calendar later today
  - Suggestion: download/print a copy ahead of time

# Administrivia

- ❖ HW1 due a week from Thursday
  - You should be well under way now
    - 🙌 🙌 🙌 🙌 if not
  - Be sure to read headers *carefully* while implementing
  - Use git add/commit/push regularly to save work when you finish another part of the job
    - And also please do this before contacting TA during office hours if you want help with your code

# Administrivia

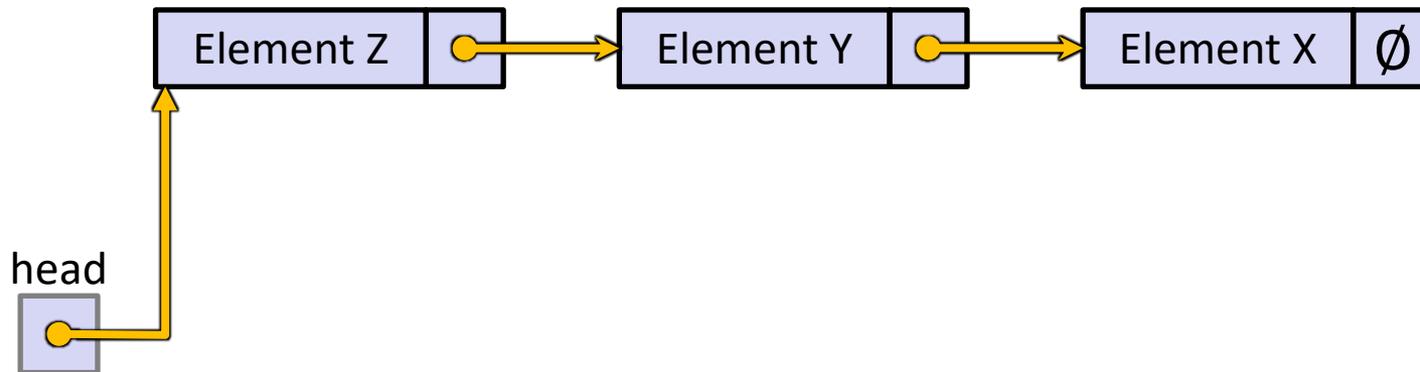

- ❖ Friday July 3<sup>rd</sup> is a holiday. No school or OH, but we will be available on the discussion board.
  - Travis July 2<sup>nd</sup> OH moved to 11:30 am -12:30 pm
  
- ❖ Non CSE students should have guest CSE credentials created for them.
  - An email should have been sent to those getting credentials
  - This means you can access exercise solutions and attu.
  - Please test it out and see if you can view the exercise solutions. Contact staff if it doesn't work.

# Lecture Outline

- ❖ **Implementing Data Structures in C**
- ❖ Multi-file C Programs
  - C Preprocessor Intro

# Simple Linked List in C

- ❖ Each node in a linear, singly-linked list contains:
  - Some element as its payload
  - A pointer to the next node in the linked list
    - This pointer is NULL (or some other indicator) in the last node in the list

# Linked List Node

- ❖ Let's represent a linked list node with a struct
  - For now, assume each element is an `int`

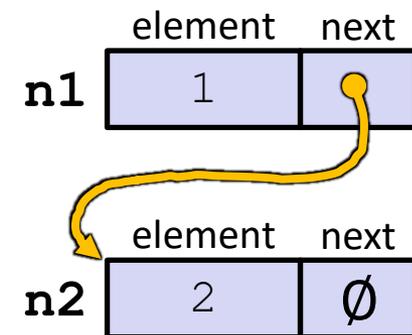

```
#include <stdio.h>

typedef struct node_st {
    int element;
    struct node_st* next;
} Node;

int main(int argc, char** argv) {
    Node n1, n2;

    n1.element = 1;
    n1.next = &n2;
    n2.element = 2;
    n2.next = NULL;
    return 0;
}
```

manual\_list.c

# Push Onto List

Arrow points to  
*next* instruction.

```
typedef struct node_st {
    int element;
    struct node_st* next;
} Node;

Node* Push(Node* head, int e) {
    Node* n = (Node*) malloc(sizeof(Node));
    assert(n != NULL); // crashes if false
    n->element = e;
    n->next = head;
    return n;
}

int main(int argc, char** argv) {
    Node* list = NULL;
    list = Push(list, 1);
    list = Push(list, 2);
    return 0;
}
```

(main) list

push\_list.c

# Push Onto List

Arrow points to  
*next* instruction.

```
typedef struct node_st {
    int element;
    struct node_st* next;
} Node;

Node* Push(Node* head, int e) {
    Node* n = (Node*) malloc(sizeof(Node));
    assert(n != NULL); // crashes if false
    n->element = e;
    n->next = head;
    return n;
}

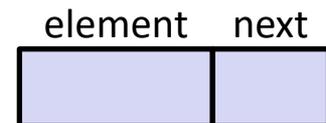

int main(int argc, char** argv) {
    Node* list = NULL;
    list = Push(list, 1);
    list = Push(list, 2);
    return 0;
}
```

(main) list 

(Push) head 

(Push) e 

(Push) n 

push\_list.c

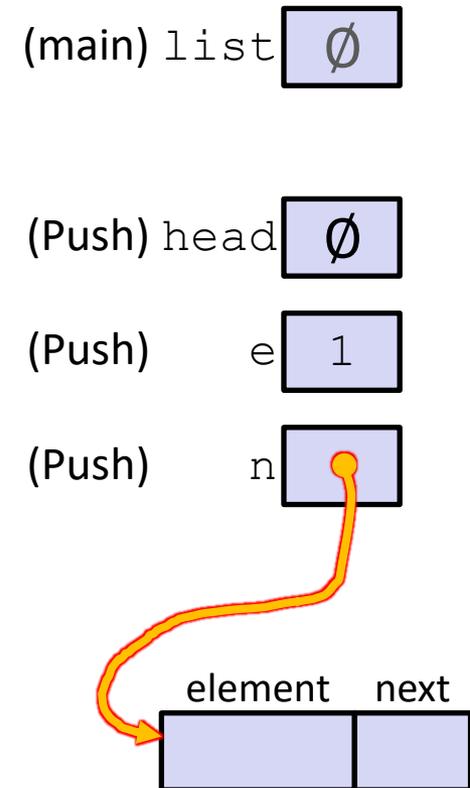

# Push Onto List

Arrow points to  
*next* instruction.

```
typedef struct node_st {
    int element;
    struct node_st* next;
} Node;

Node* Push(Node* head, int e) {
    Node* n = (Node*) malloc(sizeof(Node));
    assert(n != NULL); // crashes if false
    n->element = e;
    n->next = head;
    return n;
}

int main(int argc, char** argv) {
    Node* list = NULL;
    list = Push(list, 1);
    list = Push(list, 2);
    return 0;
}
```

    int element;
    struct node_st* next;
} Node;

Node* Push(Node* head, int e) {
    Node* n = (Node*) malloc(sizeof(Node));
    assert(n != NULL); // crashes if false
    n->element = e;
    n->next = head;
    return n;
}

int main(int argc, char** argv) {
    Node* list = NULL;
    list = Push(list, 1);
    list = Push(list, 2);
    return 0;
}
```

push\_list.c

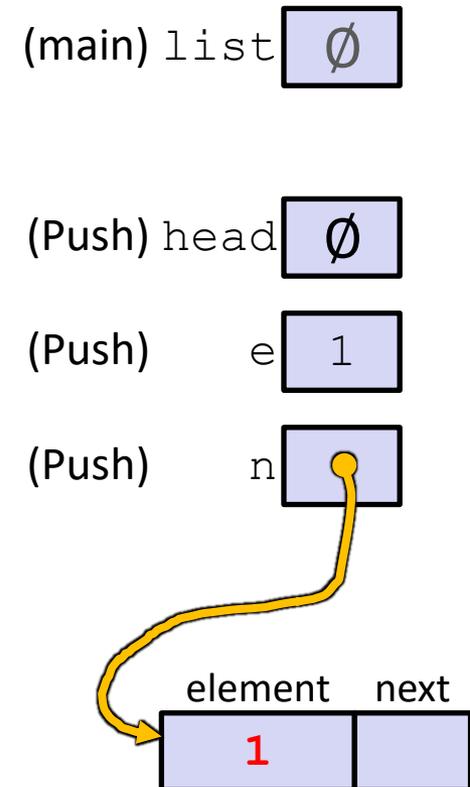

# Push Onto List

Arrow points to  
*next* instruction.

```
typedef struct node_st {
    int element;
    struct node_st* next;
} Node;

Node* Push(Node* head, int e) {
    Node* n = (Node*) malloc(sizeof(Node));
    assert(n != NULL); // crashes if false
    n->element = e;
    n->next = head;
    return n;
}

int main(int argc, char** argv) {
    Node* list = NULL;
    list = Push(list, 1);
    list = Push(list, 2);
    return 0;
}
```

push\_list.c

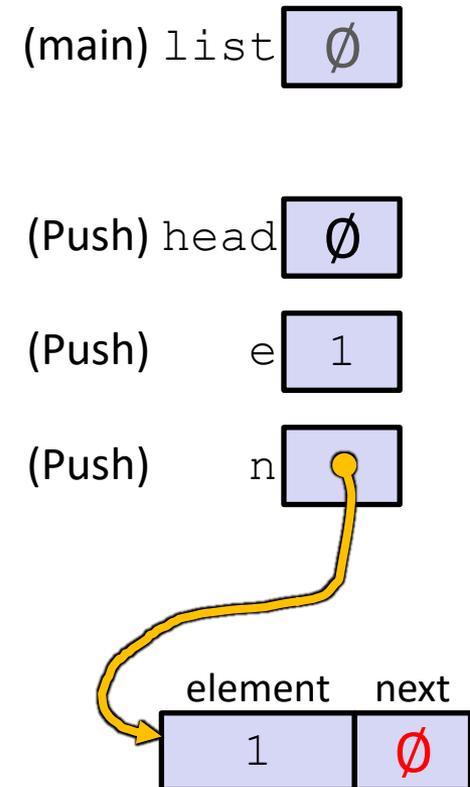

# Push Onto List

Arrow points to  
*next* instruction.

```
typedef struct node_st {
    int element;
    struct node_st* next;
} Node;

Node* Push(Node* head, int e) {
    Node* n = (Node*) malloc(sizeof(Node));
    assert(n != NULL); // crashes if false
    n->element = e;
    n->next = head;
    return n;
}

int main(int argc, char** argv) {
    Node* list = NULL;
    list = Push(list, 1);
    list = Push(list, 2);
    return 0;
}
```

push\_list.c

# Push Onto List

Arrow points to  
*next* instruction.

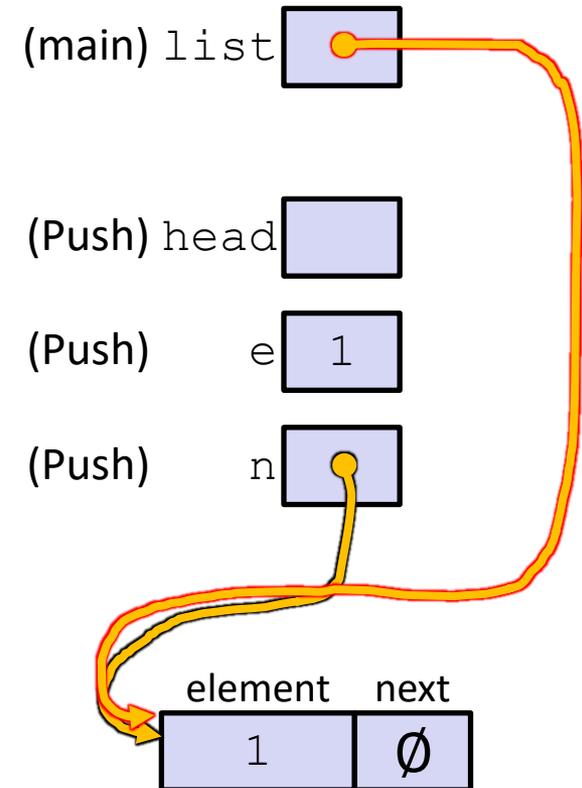

```
typedef struct node_st {
    int element;
    struct node_st* next;
} Node;

Node* Push(Node* head, int e) {
    Node* n = (Node*) malloc(sizeof(Node));
    assert(n != NULL); // crashes if false
    n->element = e;
    n->next = head;
    return n;
}

int main(int argc, char** argv) {
    Node* list = NULL;
    list = Push(list, 1);
    list = Push(list, 2);
    return 0;
}
```

push\_list.c

# Push Onto List

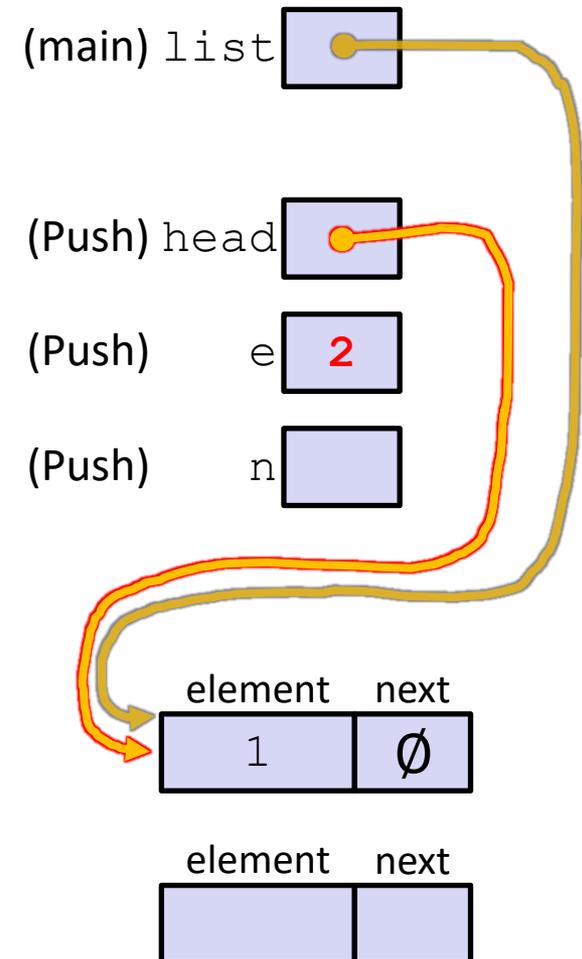

Arrow points to  
*next* instruction.

```
typedef struct node_st {
    int element;
    struct node_st* next;
} Node;

Node* Push(Node* head, int e) {
    Node* n = (Node*) malloc(sizeof(Node));
    assert(n != NULL); // crashes if false
    n->element = e;
    n->next = head;
    return n;
}

int main(int argc, char** argv) {
    Node* list = NULL;
    list = Push(list, 1);
    list = Push(list, 2);
    return 0;
}
```

push\_list.c

A (benign) memory leak!  
Try running with Valgrind:

```
bash$ gcc -Wall -g -o
push_list push_list.c

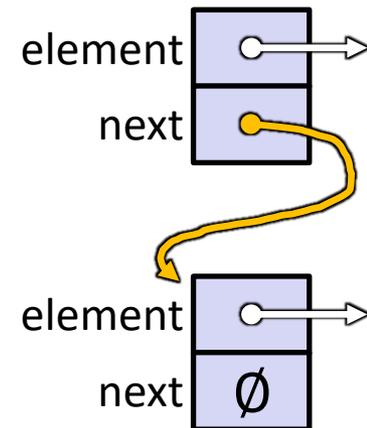

bash$ valgrind --leak-
check=full ./push_list
```

# A Generic Linked List

- ❖ Let's generalize the linked list element type
  - Let customer decide type (instead of always `int`)
  - Idea: let them use a generic pointer (*i.e.* a `void*`)

```
typedef struct node_st {  
    void* element;  
    struct node_st* next;  
} Node;  
  
Node* Push(Node* head, void* e) {  
    Node* n = (Node*) malloc(sizeof(Node));  
    assert(n != NULL); // crashes if false  
    n->element = e;  
    n->next = head;  
    return n;  
}
```

# Using a Generic Linked List

- ❖ Type casting needed to deal with `void*` (raw address)
  - Before pushing, need to convert to `void*`
  - Convert back to data type when accessing

```
typedef struct node_st {
    void* element;
    struct node_st* next;
} Node;

Node* Push(Node* head, void* e);    // assume last slide's code

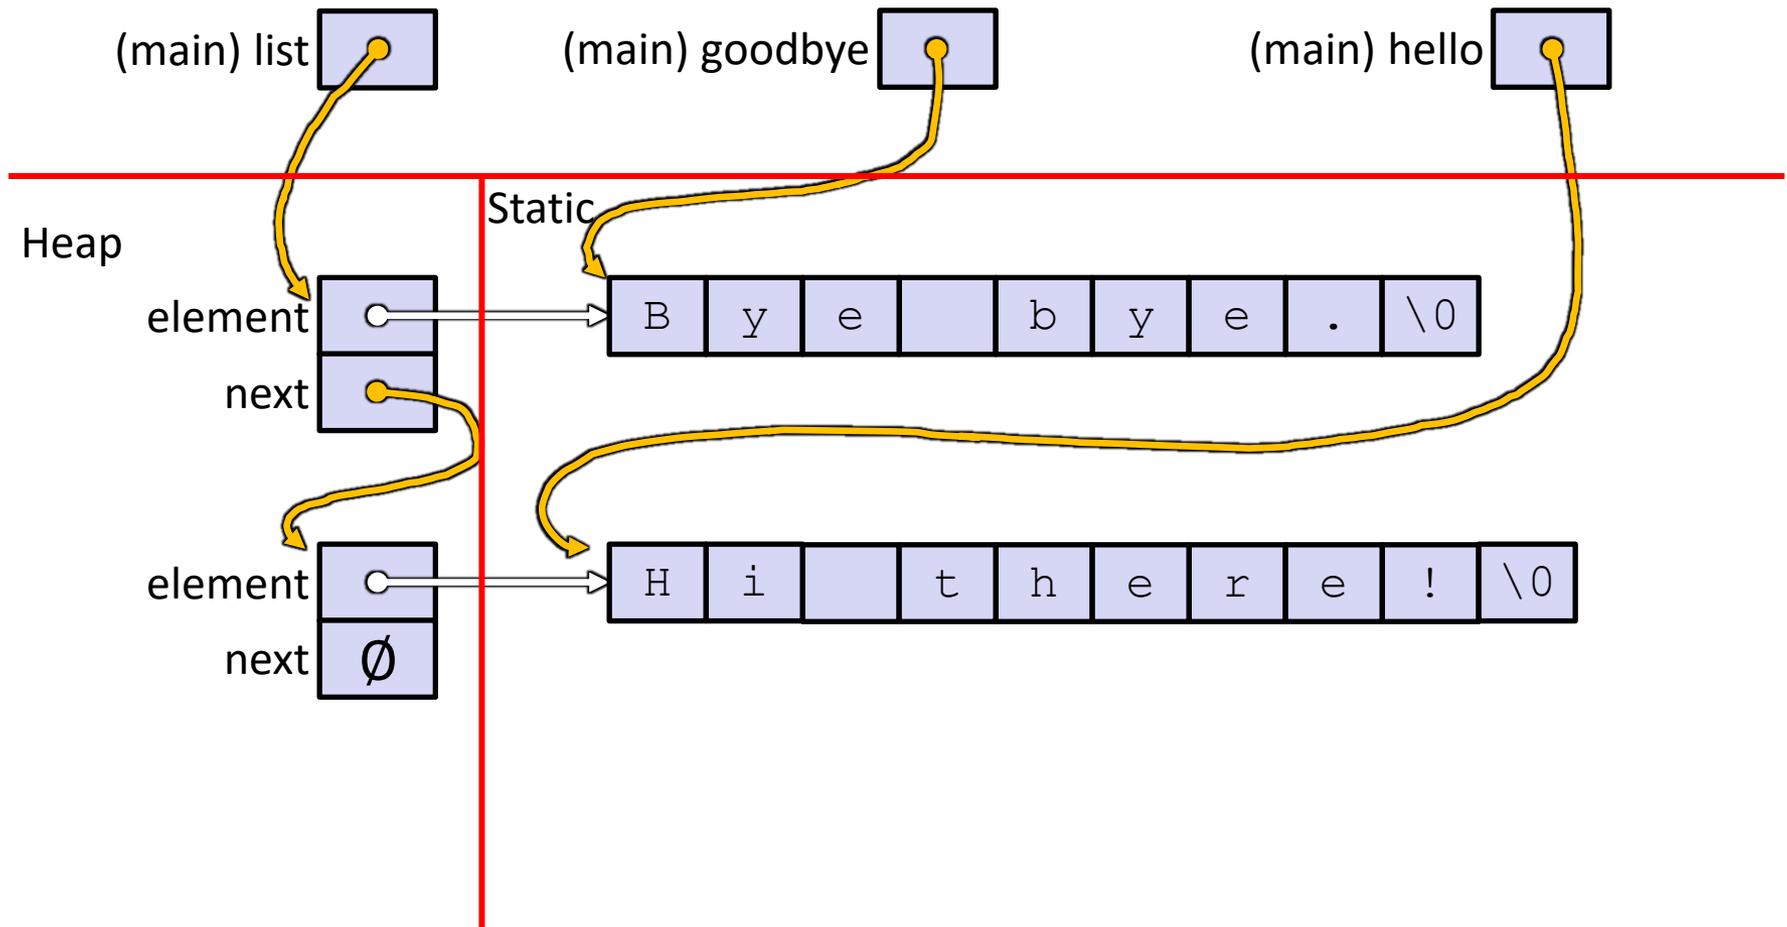

int main(int argc, char** argv) {
    char* hello = "Hi there!";
    char* goodbye = "Bye bye.";
    Node* list = NULL;

    list = Push(list, (void*) hello);
    list = Push(list, (void*) goodbye);
    printf("payload: '%s'\n", (char*) ((list->next)->element) );
    return 0;
}
```

# Resulting Memory Diagram

Stack

# Lecture Outline

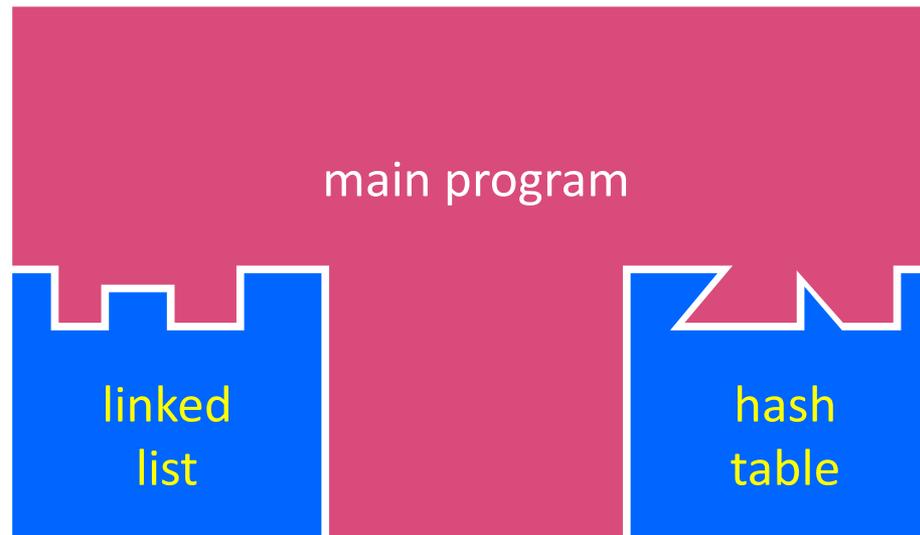

- ❖ Implementing Data Structures in C
- ❖ **Multi-file C Programs**
  - **C Preprocessor Intro**

# Multi-File C Programs

- ❖ Let's create a linked list *module*
  - A module is a self-contained piece of an overall program
    - Has externally visible functions that customers can invoke
    - Has externally visible `typedefs`, and perhaps global variables, that customers can use
    - May have internal functions, `typedefs`, or global variables that customers should *not* look at
  - The module's *interface* is its set of public functions, `typedefs`, and global variables

# Modularity

- ❖ The degree to which components of a system can be separated and recombined
  - “Loose coupling” and “separation of concerns”
  - Modules can be developed independently
  - Modules can be re-used in different projects

# C Header Files

- ❖ **Header:** a file whose only purpose is to be `#include`'d
  - Generally has a filename `.h` extension
  - Holds the variables, types, and function prototype declarations that make up the interface to a module
- ❖ **Main Idea:**
  - Every `name.c` is intended to be a module that has a `name.h`
  - `name.h` declares the interface to that module
  - Other modules can use `name` by `#include-ing` `name.h`
    - They should assume as little as possible about the implementation in `name.c`

# C Module Conventions (1 of 2)

## ❖ File contents:

- `.h` files only contain *declarations*, never *definitions*
- `.c` files never contain prototype declarations for functions that are intended to be exported through the module interface
- Public-facing functions are `ModuleName_functionname()` and take a pointer to “`this`” as their first argument

## ❖ Including:

- **NEVER** `#include` a `.c` file – only `#include .h` files
- `#include` all of headers you reference, even if another header (transitively) includes some of them

## ❖ Compiling:

- Any `.c` file with an associated `.h` file should be able to be compiled into a `.o` file
  - The `.c` file should `#include` the `.h` file; the compiler will check definitions and declarations for consistency

# C Module Conventions (2 of 2)

## ❖ Commenting:

- If a function is declared in a header file (.h) and defined in a C file (.c), *the header needs full documentation because it is the public specification*
  - Don't copy-paste the comment into the C file (don't want two copies that can get out of sync)
- If prototype and implementation are in the same C file:
  - School of thought #1: Full comment on the prototype at the top of the file, no comment (or “declared above”) on code
  - School of thought #2: Prototype is for the compiler and doesn't need comment; comment the code to keep them together

e.g. 333

project code

# #include and the C Preprocessor

- ❖ The C preprocessor (`cpp`) transforms your source code before the compiler runs – it's a simple copy-and-replace text processor(!) with a memory
  - Input is a C file (text) and output is still a C file (text)
  - Processes the directives it finds in your code (*#directive*)
    - e.g. `#include "ll.h"` is replaced by the post-processed content of `ll.h`
    - e.g. `#define PI 3.1415` defines a symbol (a string!) and replaces later occurrences
    - Several others that we'll see soon...
  - Run on your behalf by `gcc` during compilation
  - **Note:** `#include <foo.h>` looks in system (library) directories; `#include "foo.h"` looks first in current directory, then system

# C Preprocessor Example

- ❖ What do you think the preprocessor output will be?

```
#define BAR 2 + FOO
```

```
typedef long long int verylong;
```

cpp\_example.h

```
#define FOO 1
```

```
#include "cpp_example.h"
```

```
int main(int argc, char** argv) {
```

```
    int x = FOO;    // a comment
```

```
    int y = BAR;
```

```
    verylong z = FOO + BAR;
```

```
    return 0;
```

```
}
```

cpp\_example.c

# C Preprocessor Example

Arrow points to  
next line to process

- ❖ We can manually run the preprocessor:
  - `cpp` is the preprocessor (can also use `gcc -E`)
  - “`-P`” option suppresses some extra debugging annotations

```
#define BAR 2 + FOO
```

```
typedef long long int verylong;
```

`cpp_example.h`

```
#define FOO 1
```

```
#include "cpp_example.h"
```

```
int main(int argc, char** argv) {
```

```
    int x = FOO;    // a comment
```

```
    int y = BAR;
```

```
    verylong z = FOO + BAR;
```

```
    return 0;
```

```
}
```

`cpp_example.c`

```
bash$ cpp -P cpp_example.c out.c
bash$ cat out.c
```

# C Preprocessor Example

```

# C Preprocessor Example

Arrow points to  
next line to process

❖ We can manually run the preprocessor:

- `cpp` is the preprocessor (can also use `gcc -E`)
- “-P” option suppresses some extra debugging annotations

Pre-processor state

FOO	1
BAR	2 + 1

```
#define BAR 2 + FOO
typedef long long int verylong;
```

cpp\_example.h

```
#define FOO 1
#include "cpp_example.h"
int main(int argc, char** argv) {
    int x = FOO; // a comment
    int y = BAR;
    verylong z = FOO + BAR;
    return 0;
}
```

cpp\_example.c

```
bash$ cpp -P cpp_example.c out.c
bash$ cat out.c
```

```
typedef long long int verylong;
int main(int argc, char **argv) {
    int x = 1;
    int y = 2 + 1;
    verylong z = 1 + 2 + 1;
    return 0;
}
```

# Program Using a Linked List

```
#include <stdlib.h>
#include <assert.h>
#include "ll.h"

Node* Push(Node* head,
           void* element) {
    ... // implementation here
}
```

ll.c

```
typedef struct node_st {
    void* element;
    struct node_st* next;
} Node;

Node* Push(Node* head,
           void* element);
```

ll.h

Need definitions in order for code to compile

```
#include "ll.h"

int main(int argc, char** argv) {
    Node* list = NULL;
    char* hi = "hello";
    char* bye = "goodbye";

    list = Push(list, (void*)hi);
    list = Push(list, (void*)bye);

    ...

    return 0;
}
```

example\_ll\_customer.c

# Compiling the Program

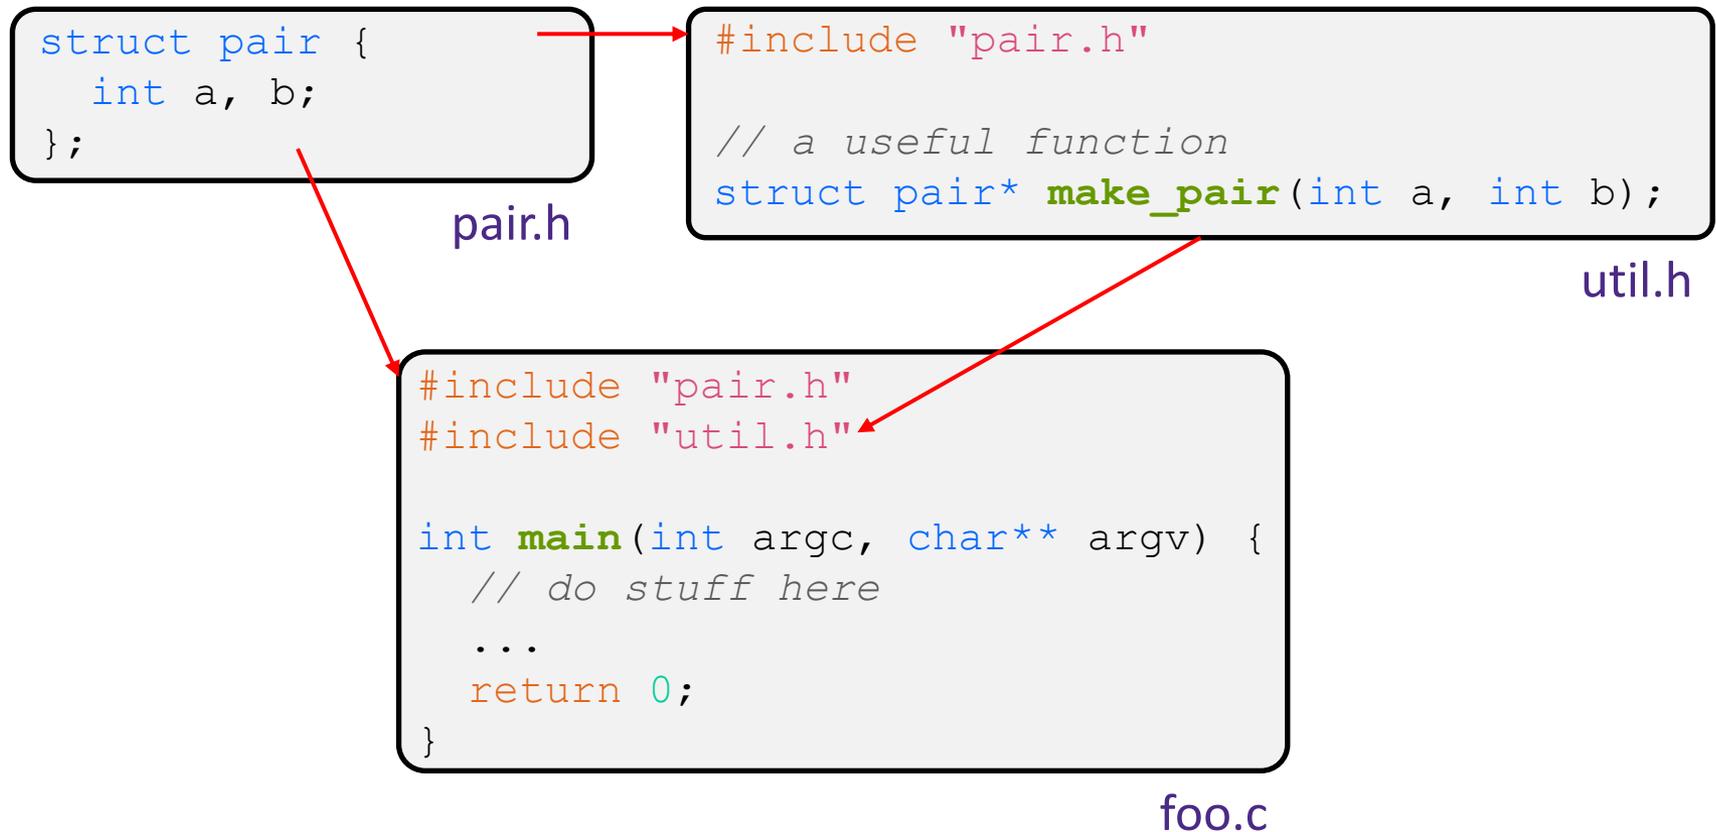

## ❖ Four parts:

- 1/2) Compile `example_ll_customer.c` into an object file
- 2/1) Compile `ll.c` into an object file
- 3) Link both object files into an executable
- 4) Test, Debug, Rinse, Repeat

```
1 bash$ gcc -Wall -g -c -o example_ll_customer.o example_ll_customer.c
2 bash$ gcc -Wall -g -c -o ll.o ll.c
3 bash$ gcc -g -o example_ll_customer ll.o example_ll_customer.o
4 bash$ ./example_ll_customer
Payload: 'yo!'
Payload: 'goodbye'
Payload: 'hello'
4 bash$ valgrind -leak-check=full ./example_ll_customer
... etc ...
```

# But There's a Problem with #include

- ❖ What happens when we compile `foo.c`?

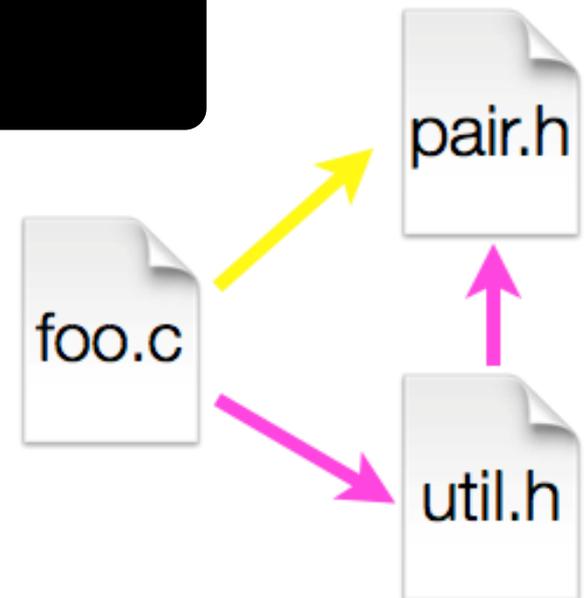

# A Problem with #include

- ❖ What happens when we compile `foo.c`?

```
bash$ gcc -Wall -g -o foo foo.c
In file included from util.h:1:0,
                 from foo.c:2:
pair.h:1:8: error: redefinition of 'struct pair'
   struct pair { int a, b; };
       ^
In file included from foo.c:1:0:
pair.h:1:8: note: originally defined here
   struct pair { int a, b; };
       ^
```

- ❖ `foo.c` includes `pair.h` twice!
  - Second time is indirectly via `util.h`
  - Struct definition shows up twice
    - Can see using `cpp`

# Preprocessor Tricks: Header Guards

- ❖ A standard C Preprocessor trick to deal with this Pre-processor state
  - Uses macro definition (`#define`) in combination with conditional compilation (`#ifndef` and `#endif`)

```
#ifndef PAIR_H_
#define PAIR_H_

struct pair {
    int a, b;
};

#endif // PAIR_H_
```

pair.h

```
#ifndef UTIL_H_
#define UTIL_H_

#include "pair.h"

// a useful function
struct pair* make_pair(int a, int b);

#endif // UTIL_H_
```

util.h

foo.c

→

```
#include "pair.h"
#include "util.h"

int main(int argc, char** argv) {
```

# Preprocessor Tricks: Header Guards

- ❖ A standard C Preprocessor trick to deal with this Pre-processor state
  - Uses macro definition (`#define`) in combination with conditional compilation (`#ifndef` and `#endif`)

```

#ifndef PAIR_H_
#define PAIR_H_

struct pair {
    int a, b;
};

#endif // PAIR_H_

```

pair.h

```

#ifndef UTIL_H_
#define UTIL_H_

#include "pair.h"

// a useful function
struct pair* make_pair(int a, int b);

#endif // UTIL_H_

```

util.h

foo.c

```

#include "pair.h"
#include "util.h"

int main(int argc, char** argv) {

```

```

util.h

```
#include "pair.h"
#include "util.h"

int main(int argc, char** argv) {
```

foo.c

# Preprocessor Tricks: Constants

- ❖ A way to deal with “magic constants”

```
int globalbuffer[1000];

void circalc(float rad,
             float* circumf,
             float* area) {
    *circumf = rad * 2.0 * 3.1415;
    *area = rad * 3.1415 * 3.1415;
}
```

Bad code

(littered with magic constants)

```
#define BUFSIZE 1000
#define PI 3.14159265359

int globalbuffer[BUFSIZE];

void circalc(float rad,
             float* circumf,
             float* area) {
    *circumf = rad * 2.0 * PI;
    *area = rad * PI * PI;
}
```

Better code

# Extra Exercise #1

- ❖ Extend the linked list program we covered in class:
  - Add a function that returns the number of elements in a list
  - Implement a program that builds a list of lists
    - *i.e.* it builds a linked list where each element is a (different) linked list
  - Bonus: design and implement a “Pop” function
    - Removes an element from the head of the list
    - Make sure your linked list code, and customers’ code that uses it, contains no memory leaks

# Extra Exercise #2

- ❖ Implement and test a binary search tree
  - [https://en.wikipedia.org/wiki/Binary\\_search\\_tree](https://en.wikipedia.org/wiki/Binary_search_tree)
    - Don't worry about making it balanced
  - Implement key insert() and lookup() functions
    - Bonus: implement a key delete() function
  - Implement it as a C module
    - `bst.c`, `bst.h`
  - Implement `test_bst.c`
    - Contains `main()` and tests out your BST

# Extra Exercise #3

- ❖ Implement a Complex number module
  - `complex.c`, `complex.h`
  - Includes a typedef to define a complex number
    - $a + bi$ , where `a` and `b` are `doubles`
  - Includes functions to:
    - add, subtract, multiply, and divide complex numbers
  - Implement a test driver in `test_complex.c`
    - Contains `main()`
