

W UNIVERSITY of WASHINGTON L24: Concurrency and Processes CSE333, Summer 2020

## Creating New Processes

- ❖ `pid_t fork();`
  - Creates a new process (the “child”) that is an *exact clone\** of the current process (the “parent”)
    - \*Everything is cloned except threads. Sockets, file descriptors, virtual address space, variables, etc.
  - The new process has a separate virtual address space from the parent

## fork()

- ❖ `fork()` has peculiar semantics
  - The parent invokes `fork()`
  - The OS clones the parent
  - Both the parent and the child return from `fork`
    - Parent receives child’s pid
    - Child receives a 0

❖ See `fork_example.cc`

CSE 351 review:  
When a child process exits, it is a zombie until its parent reaps it.

**Poll Everywhere** [pollev.com/cse33320su](https://pollev.com/cse33320su)

- ❖ What will happen when one of the grandchildren processes finishes?

A. Zombie until grandparent exits  
 B. Zombie until grandparent reaps  
 C. Zombie until init reaps  
 D. ZOMBIE FOREVER!!!  
 E. We’re lost...

23

W UNIVERSITY of WASHINGTON L24: Concurrency and Processes CSE333, Summer 2020

## Why Concurrent Processes?

- ❖ Advantages:
  - No shared memory between processes
  - No need for language support; OS provides “fork”
  - Concurrent execution leads to better CPU, network utilization
- ❖ Disadvantages:
  - Processes are heavyweight
    - Relatively slow to fork
    - Context switching latency is high
  - Communication between processes is complicated
