Poll Everywhere

pollev.com/cse333

How is course setup going for you?

Vote for *each* of CSE Linux environment, text editor, and Gitlab/git.

A. Done! Went (relatively) smoothly.

B. Done! Was tough to set up.

C. Still working on it.

D. Haven't tried to set it up yet.

Poll Everywhere

pollev.com/cse333

About how long did Exercise 1 take you?

A. [0, 2) hours
B. [2, 4) hours
C. [4, 6) hours
D. [6, 8) hours
E. 8+ Hours
F. I didn't submit / I prefer not to say

C Data, Parameters

CSE 333 Summer 2023

Instructor: Timmy Yang

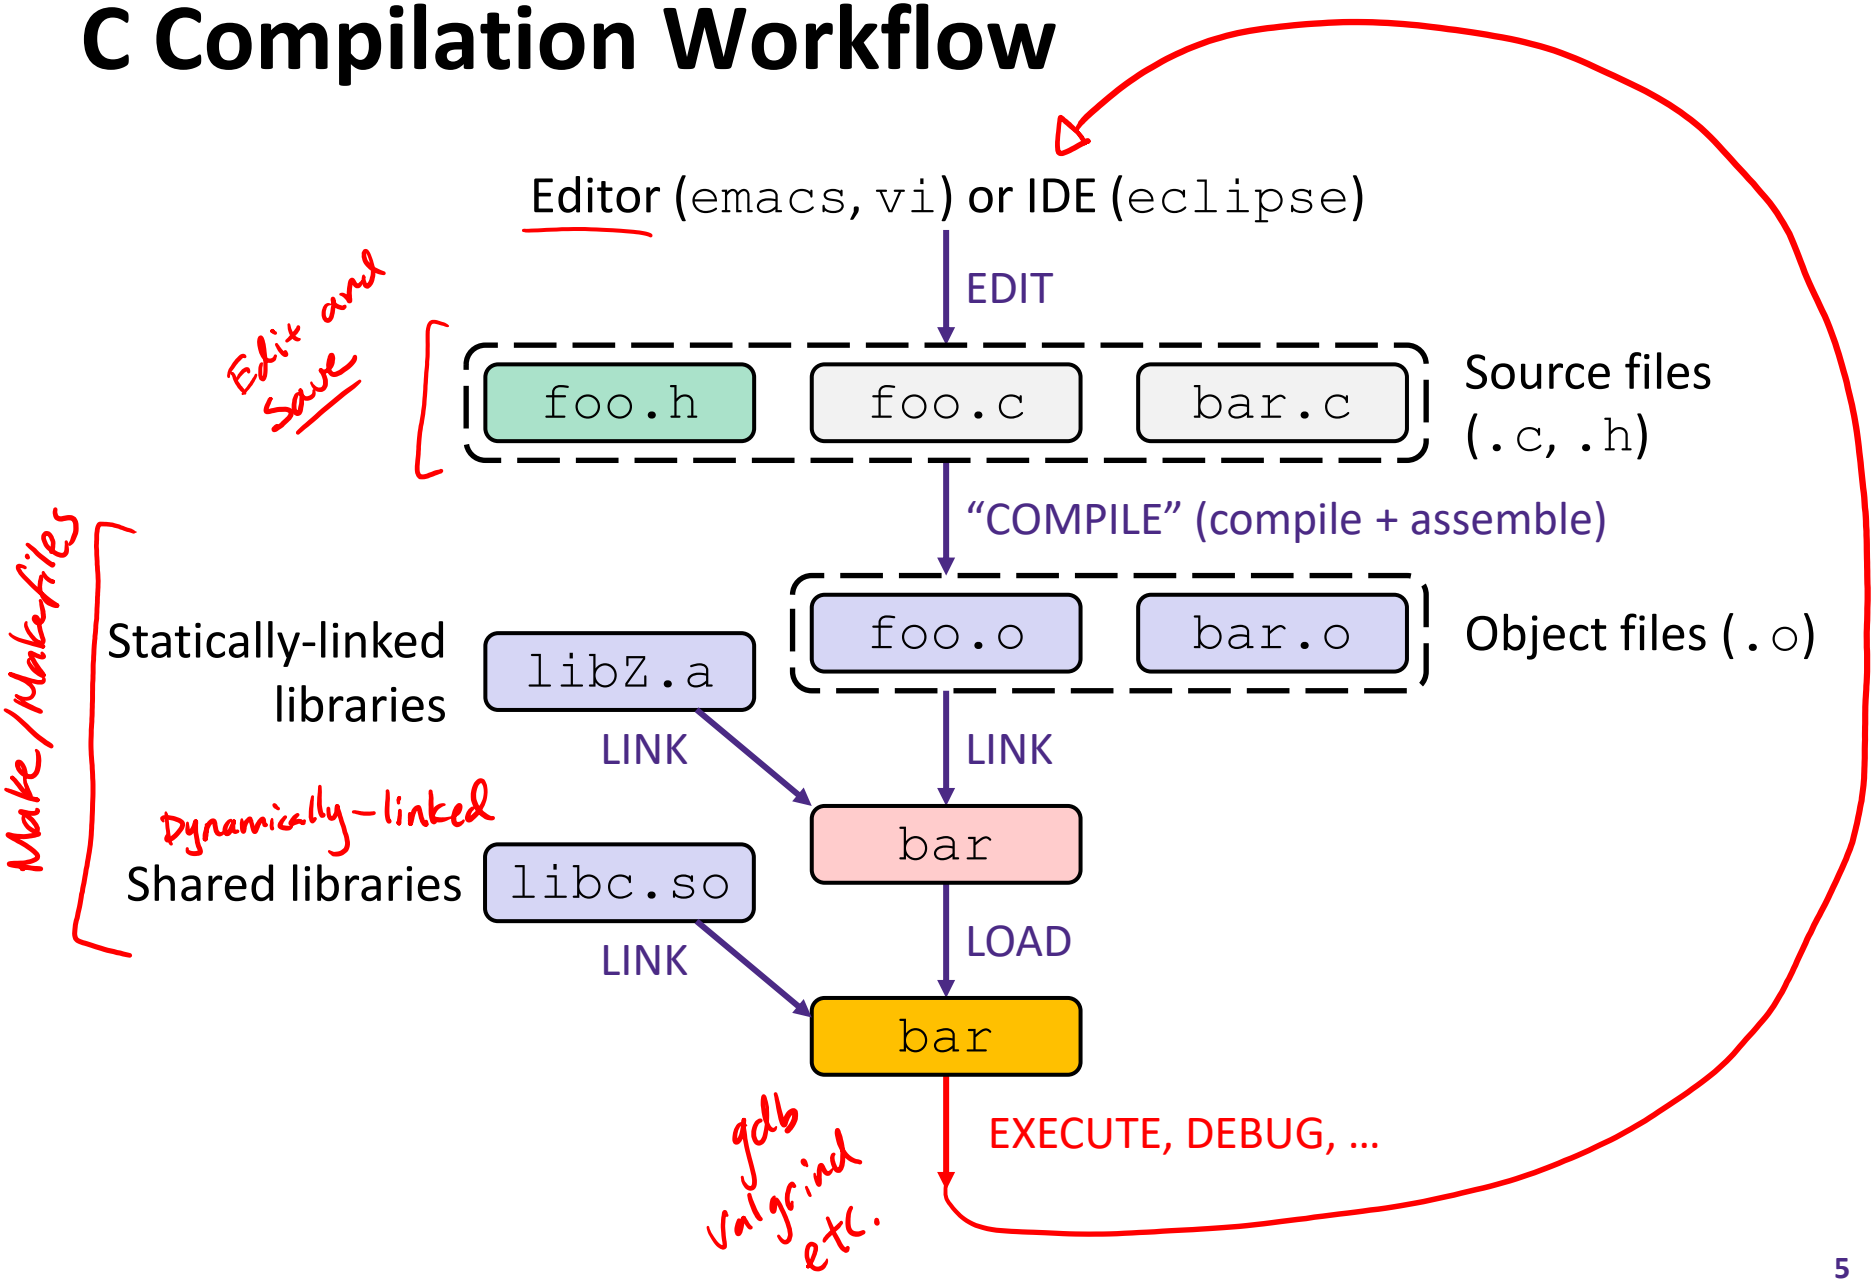
Teaching Assistants:

Jennifer Xu
Leanna Nguyen
Pedro Amarante
Sara Deutscher
Tanmay Shah

Relevant Course Information

- Pre-quarter survey due tonight, 11:59 pm (Canvas)
- Exercise 1 due earlier today, 1:00pm
  - Submission via Gradescope (contact us if you don't have access)
  - Make sure that you are testing on the CSE Linux environment
  - Sample solution will be posted tomorrow afternoon
- Homework 0 due Monday night, 11:59 pm
  - Logistics and infrastructure for projects
    - `cpplint` and `valgrind` are useful for exercises, too
  - Should have set up an SSH key and cloned GitLab repo by now
    - Do this ASAP so we have time to fix things if necessary
  - We will submit to Gradescope from your repo for you

C Compilation Workflow



Multi-file C Programs

Note: This example has poor style for code split. More on multiple files in Lecture 5.

C source file 1 (sumstore.c)

```
void SumStore(int x, int y, int* dest) {
  *dest = x + y;
}
```

Definition Here

C source file 2 (sumnum.c)

```
#include <stdio.h>
#include <stdlib.h>

void SumStore(int x, int y, int* dest);

int main(int argc, char** argv) {
  int z, x = 351, y = 333;
  SumStore(x, y, &z);
  printf("%d + %d = %d\n", x, y, z);
  return EXIT_SUCCESS;
}
```

Declaration Here

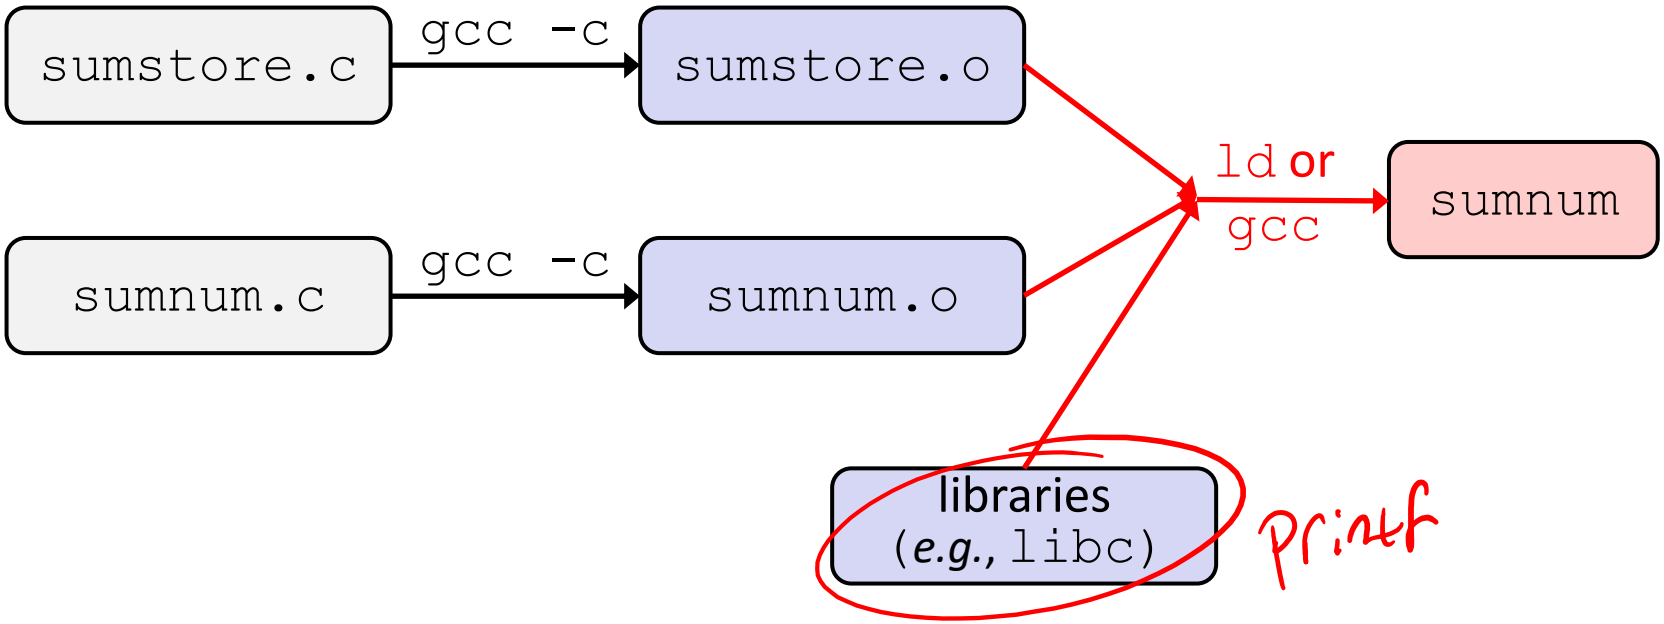
Compile together:

Both files in compilation

```
$ gcc -o sumnum sumnum.c sumstore.c
```

Compiling Multi-file Programs

- The **linker** combines multiple object files plus statically-linked libraries to produce an executable
  - Includes many standard libraries (*e.g.*, `libc`, `crt1`)
    - A *library* is just a pre-assembled collection of `.o` files



Poll Everywhere

pollev.com/cse333

Which of the following statements is FALSE?

A. With the standard `main` syntax, it is always safe to use `argv[0]` → name of executable

B. Your program's returned status code is unimportant

C. Using function declarations is beneficial to both single- and multi-file C programs single: flexibility multi: use defs from other files

D. Defined error constants need to be looked up in function documentation, man pages, or header files like errno.h

E. We're lost…

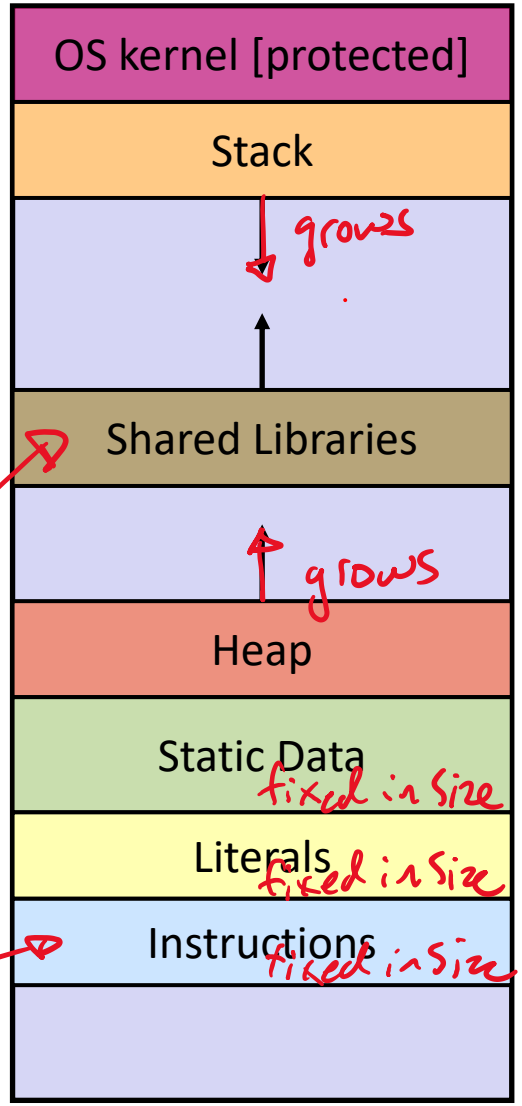
Lecture Outline

- **C Data Considerations**
  - **Memory, Integers**
  - **Arrays and Pointers Review**
- C Parameters
  - Arrays and Pointers as Parameters

Memory Management

Virtual Memory

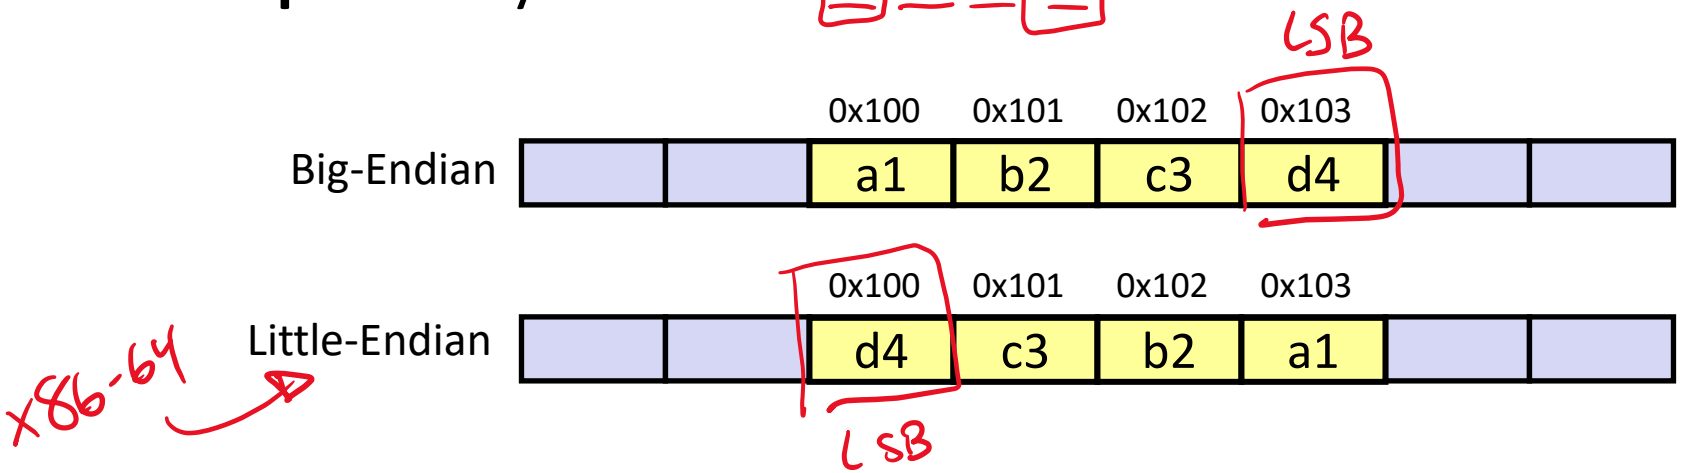
- *Local* variables on the Stack
  - **Automatically-**allocated and deallocated via calling conventions (`push`, `pop`, `mov`)
- *Global* and *static* variables in Data
  - **Statically-**allocated when the process starts and deallocated when it exits
- `malloc`-ed data on the Heap
  - **Dynamically-**allocated by process
  - Must call `free()` to free, otherwise a memory leak



Endianness

- Memory is byte-addressed, so endianness determines what ordering that multi-byte data gets read and stored *in memory*
  - Big-endian: Least significant byte has *highest* address
  - Little-endian: Least significant byte has *lowest* address

- **Example:** 4-byte data 0xa1b2c3d4 at address 0x100



C Primitive Types and Memory

- Integer types
  - `char`, `int`
- Floating point
  - `float`, `double`
- Modifiers
  - `short` [int]
  - `long` [int, double]
  - `signed` [char, int]
  - `unsigned` [char, int]

Do not memorize, these aren't strict sizes!

C Data Type	32-bit	64-bit	printf
char	1	1	%c
short int	2	2	%hd
unsigned short int	2	2	%hu
int	4	4	%d / %i
unsigned int	4	4	%u
long int	4	8	%ld
long long int	8	8	%lld
float	4	4	%f
double	8	8	%lf
long double	12	16	%Lf
pointer	4	8	%p

C99 Extended Integer Types

- Solves the conundrum of "how big is an `long int`?"

```
#include <stdint.h>

void Foo(void) {
  int8_t  a;  // exactly 8 bits, signed
  int16_t b;  // exactly 16 bits, signed
  int32_t c;  // exactly 32 bits, signed
  int64_t d;  // exactly 64 bits, signed
  uint8_t w;  // exactly 8 bits, unsigned
  ...
}
```

Generic C code

```
void SumStore(int x, int y, int* dest) {
```

"Systems" Code

```
void SumStore(int32_t x, int32_t y, int32_t* dest) {
```

Pointers

- Variables that store addresses
  - It points to somewhere in the process' virtual address space
  - `&foo` produces the virtual address of `foo`
- Generic definition: `type* name;` or `type *name;`
  - Recommended: do not define multiple pointers on same line:
    `int *p1, p2;` not the same as `int *p1, *p2;`
  - Instead, use:

```
int *p1;
int *p2;
```

- *Dereference* a pointer using the unary `*` operator
  - Access the memory referred to by a pointer

Pointer Arithmetic

- Pointers are *typed*
  - Tells the compiler the size of the data you are pointing to
  - Exception: `void*` is a generic pointer (*i.e.*, a placeholder)
- Pointer arithmetic is scaled by `sizeof(*p)`
  - Works nicely for arrays
  - Does not work on `void*`, since `void` doesn't have a size!
    - Not allowed, though confusingly GCC allows it as an extension ☹
- Valid pointer arithmetic:
  - Add/subtract an integer to/from a pointer
  - Subtract two pointers (within stack frame or malloc block)
  - Compare pointers (<, <=, ==, !=, >, >=), including `NULL`
  - … but plenty of valid-but-inadvisable operations, too

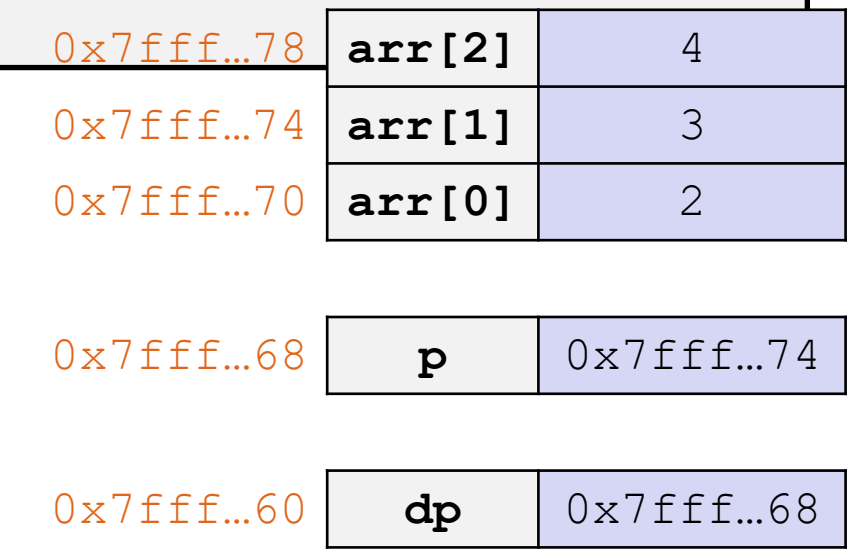
Poll Everywhere

pollev.com/cse333

At this point in the code, what values are stored in `arr[]`?

ptr_poll.c

```
int main(int argc, char** argv) {
  int arr[3] = {2, 3, 4};
  int* p = &arr[1];
  int** dp = &p;  // pointer to a pointer
  *(*dp) += 1;
  p += 1;
  *(*dp) += 1;
  return EXIT_SUCCESS;
}
```



A. {2, 3, 4}
B. {3, 4, 5}
C. {2, 6, 4}
D. {2, 4, 5}
E. We're lost…

Practice Solution

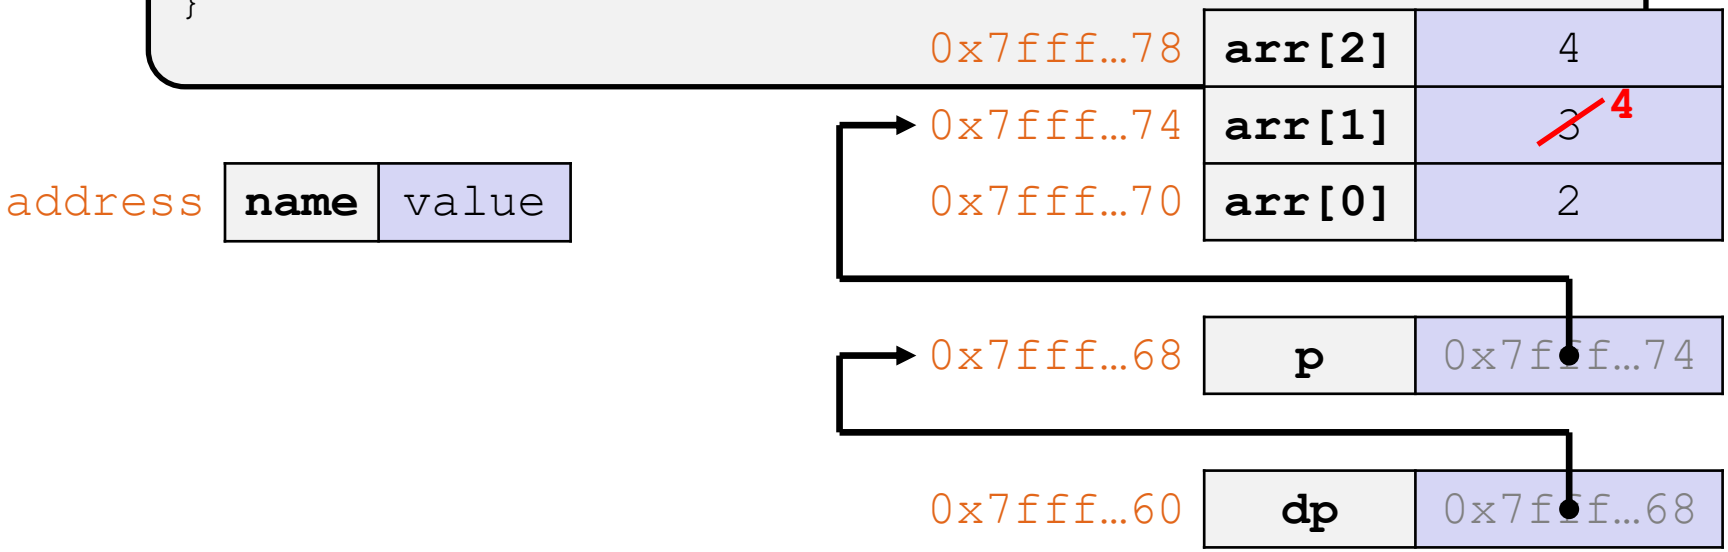
Note: arrow points to *next* instruction to be executed.

ptr_poll.c

```
int main(int argc, char** argv) {
  int arr[3] = {2, 3, 4};
  int* p = &arr[1];
  int** dp = &p;  // pointer to a pointer

  *(*dp) += 1;
  p += 1;
  *(*dp) += 1;

  return EXIT_SUCCESS;
}
```



Practice Solution

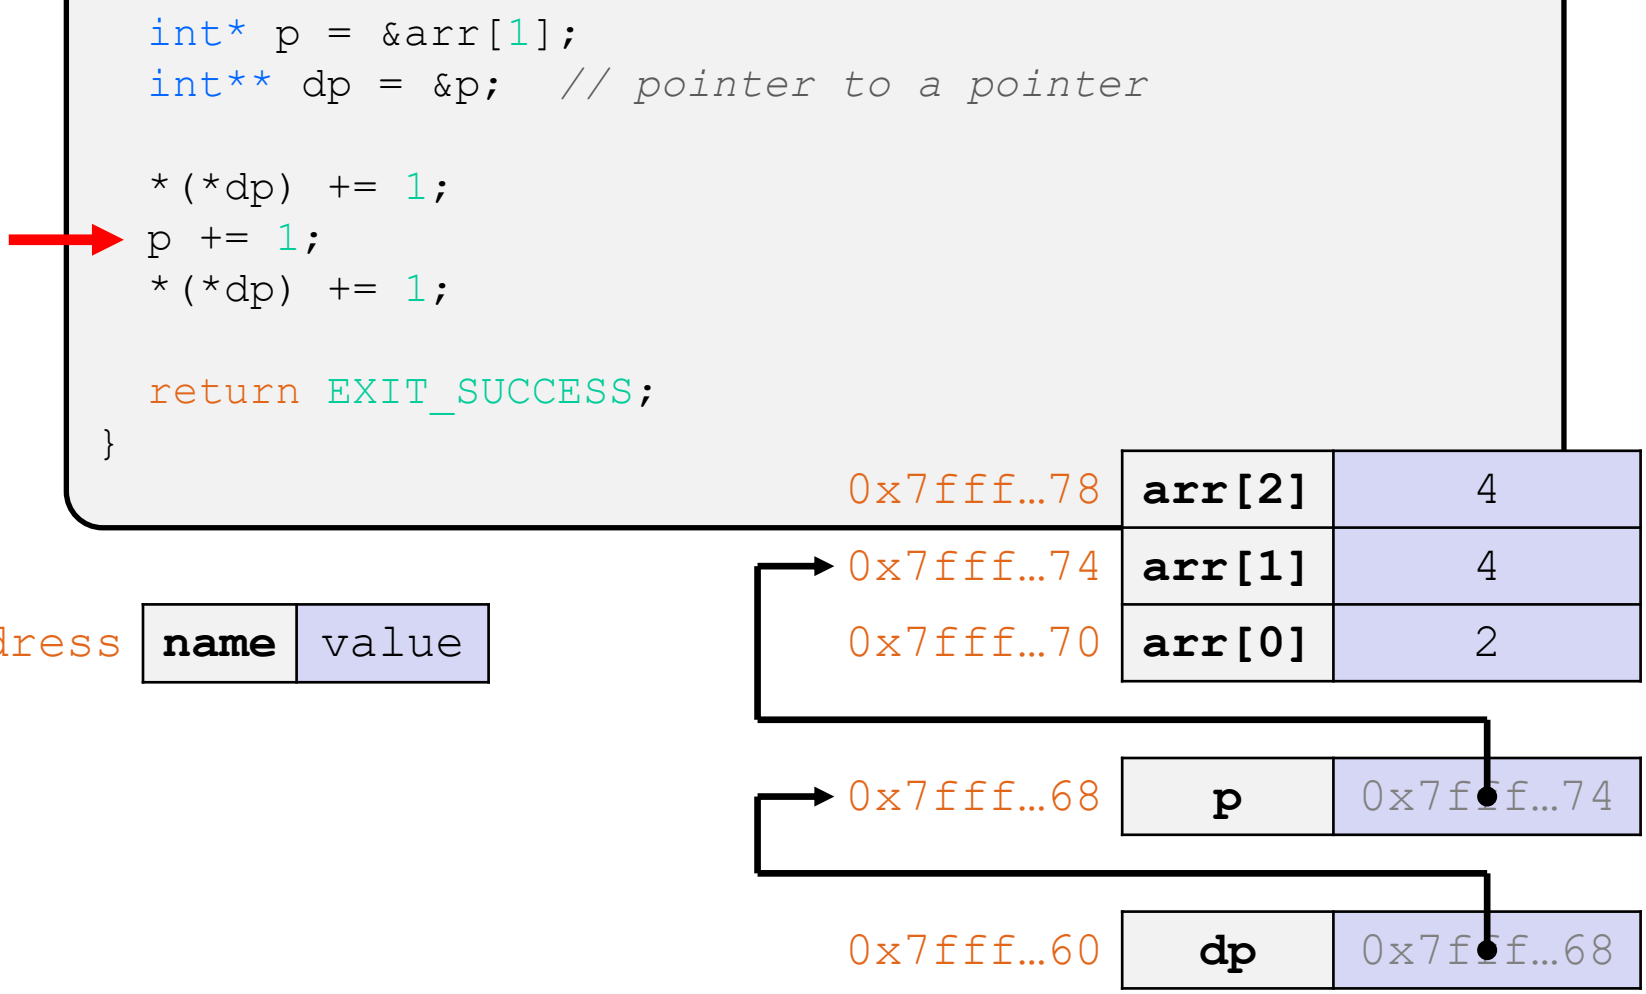
Note: arrow points to *next* instruction to be executed.

ptr_poll.c

```
int main(int argc, char** argv) {
  int arr[3] = {2, 3, 4};
  int* p = &arr[1];
  int** dp = &p;  // pointer to a pointer

  *(*dp) += 1;
  p += 1;
  *(*dp) += 1;

  return EXIT_SUCCESS;
}
```



address	name	value

Practice Solution

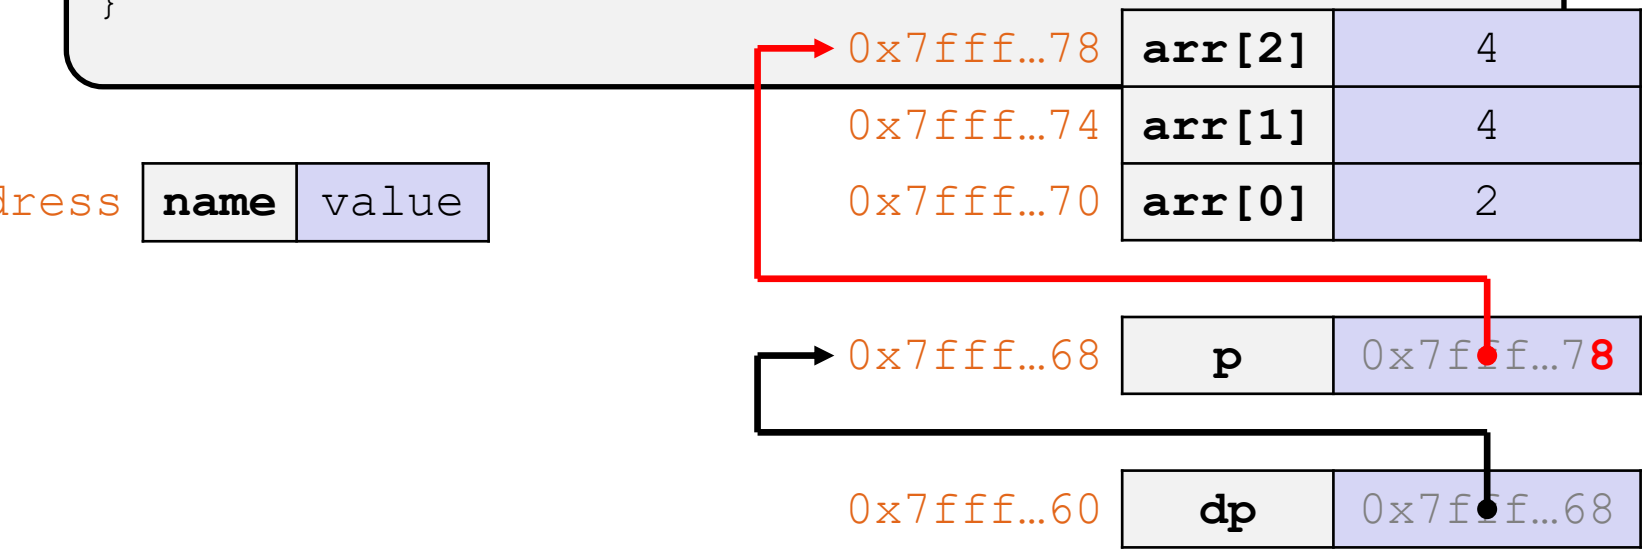
Note: arrow points to *next* instruction to be executed.

ptr_poll.c

```
int main(int argc, char** argv) {
  int arr[3] = {2, 3, 4};
  int* p = &arr[1];
  int** dp = &p;  // pointer to a pointer

  *(*dp) += 1;
  p += 1;
  *(*dp) += 1;

  return EXIT_SUCCESS;
}
```



address	name	value

Practice Solution

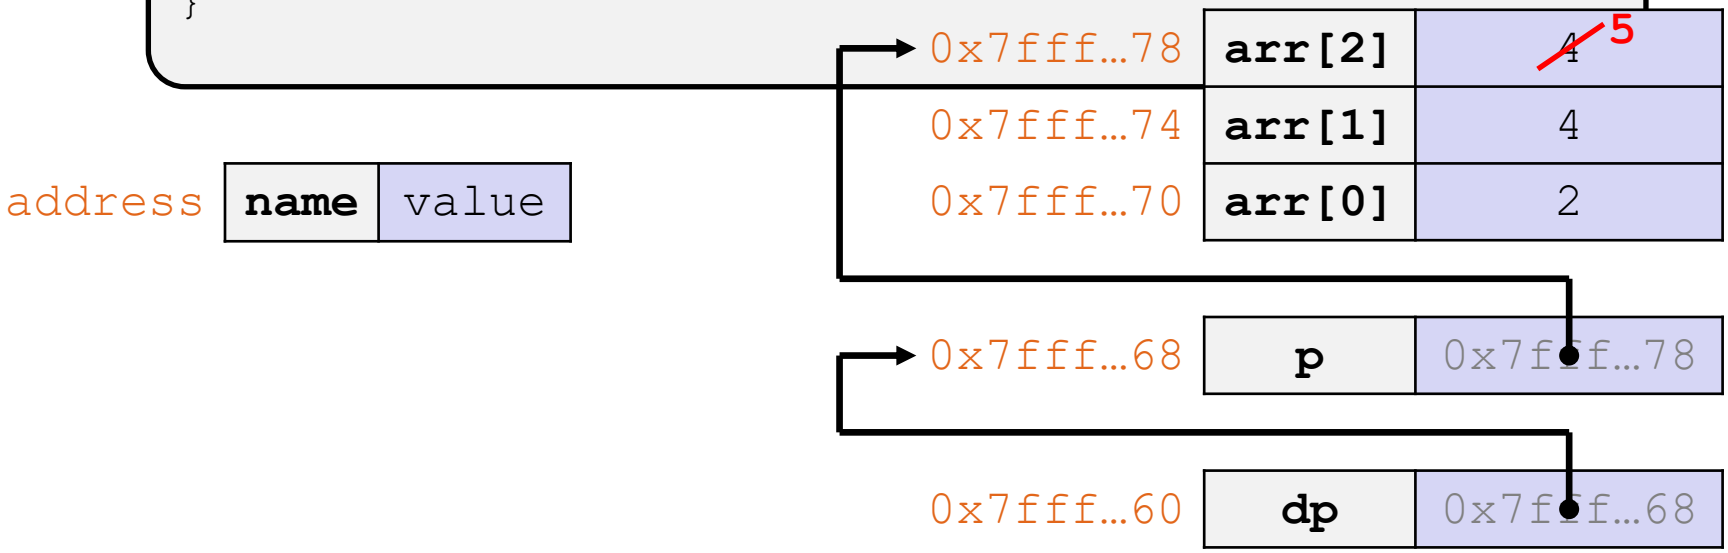
Note: arrow points to *next* instruction to be executed.

ptr_poll.c

```
int main(int argc, char** argv) {
  int arr[3] = {2, 3, 4};
  int* p = &arr[1];
  int** dp = &p;  // pointer to a pointer

  *(*dp) += 1;
  p += 1;
  *(*dp) += 1;

  return EXIT_SUCCESS;
}
```



Arrays

- Definition: `type name[size]` allocates `size*sizeof(type)` bytes of *contiguous* memory
  - By default, array values are "mystery" data (*i.e.*, uninitialized)
  - Normal usage is a compile-time constant for `size` (*e.g.*, `int scores[175];`)

- Size of an array
  - Not stored anywhere – array does not know its own size!
    - `sizeof(array)` only works in the variable scope of array definition
  - Recent versions of C (but *not* C++) allow for variable-length arrays
    - Uncommon and can be considered bad practice [*we won't use*]

```
int n = 175;
int scores[n];  // OK in C99
```

Using Arrays

- Initialization: `type name[size] = {val0,…,valN};`
  - `{ }` initialization can *only* be used at time of definition
  - If no size supplied, infers from length of array initializer

- Array name used as identifier for "collection of data"
  - Array name produces the address of the start of the array
    - Cannot be assigned to / changed
  - `name[index]` specifies an element of the array and can be used as an assignment target or as a value in an expression

```
int primes[6] = {2, 3, 5, 6, 11, 13};
primes[3] = 7;
primes[100] = 0;  // memory smash!
```

Pointers and Arrays

- A pointer can point to an array element
  - You can use array indexing notation on pointers
    - `ptr[i]` is `*(ptr+i)` with pointer arithmetic – reference the data `i` elements forward from `ptr`
  - An array name's value is the beginning address of the array
    - *Like* a pointer to the first element of array, but can't change

ptr[i] ⟷ *(ptr+i) ⟷ *(i+ptr)

i[ptr]

DO NOT DO THIS

```
int a[] = {10, 20, 30, 40, 50};
int* p1 = &a[3];  // refers to a's 4th element
int* p2 = &a[0];  // refers to a's 1st element
int* p3 = a;      // refers to a's 1st element

*p1 = 100;
*p2 = 200;
p1[1] = 300;
p2[1] = 400;
p3[2] = 500;      // final: 200, 400, 500, 100, 300
```

Lecture Outline

- C Data Considerations
  - Memory, Integers
  - Arrays and Pointers Review
- **C Parameters**
  - **Arrays and Pointers as Parameters**

Parameters: reference vs. value

- There are two fundamental parameter-passing schemes in programming languages
- Call-by-value / "Pass-by-value"
  - Parameter is a local variable initialized with a copy of the calling argument when the function is called; manipulating the parameter only changes the copy, *not* the calling argument
  - **C**, **Java**, C++ (most things)
- Call-by-reference / "Pass-by-reference"
  - Parameter is an alias for the supplied argument; manipulating the parameter manipulates the calling argument
  - C++ references (we'll see these later)

Faking Call-By-Reference in C

- Can use pointers to *approximate* call-by-reference
  - Callee still receives a **copy** of the pointer (*i.e.*, call-by-value), but it can modify something in the caller's scope by dereferencing the pointer parameter

```
void Swap(int* a, int* b) {
  int tmp = *a;
  *a = *b;
  *b = tmp;
}

int main(int argc, char** argv) {
  int a = 42, b = -7;
  Swap(&a, &b);
  ...
```

Callee

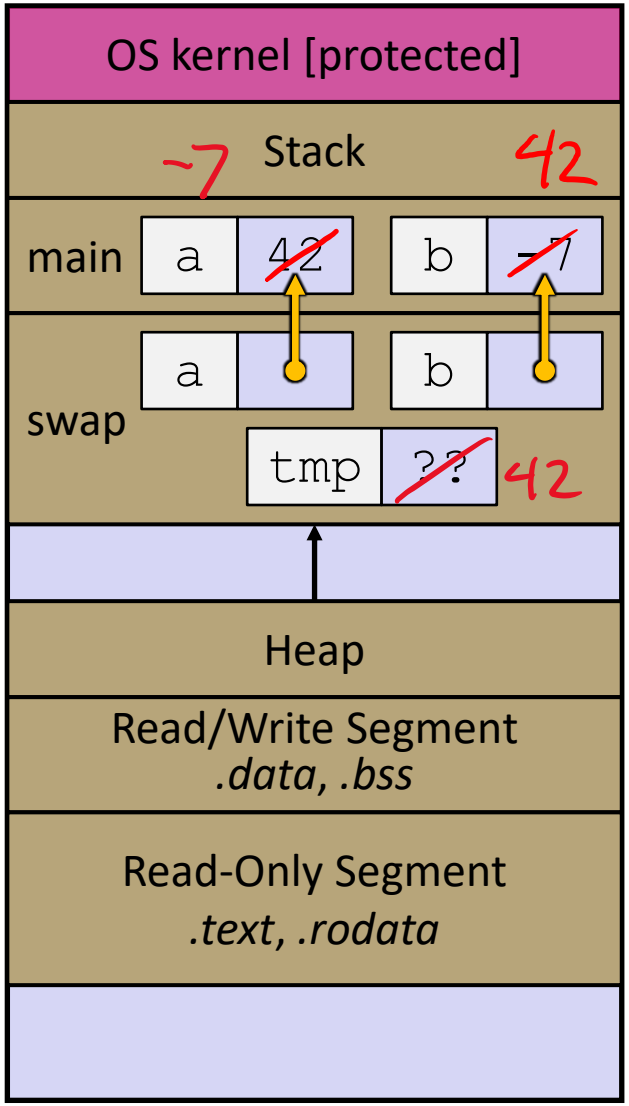
Caller

Fixed Swap

swap.c

```
void Swap(int* a, int* b) {
  int tmp = *a;
  *a = *b;
  *b = tmp;
}

int main(int argc, char** argv) {
  int a = 42, b = -7;
  Swap(&a, &b);
  ...
```



Arrays as Parameters

- It's tricky to use arrays as parameters
  - What happens when you use an array name as an argument?
  - Arrays do not know their own size

```
// sums all elements of the array a
int SumAll(int a[]);

int main(int argc, char** argv) {
  int numbers[] = {9, 8, 1, 9, 5};
  int sum = SumAll(numbers);
  return EXIT_SUCCESS;
}

int SumAll(int a[]) {
  int i, sum = 0;
  for (i = 0; i < ...???
}
```

Solution 1: Declare Array Size

```
// sums all elements of the array a
int SumAll(int a[5]);  // prototype

int main(int argc, char** argv) {
  int numbers[] = {9, 8, 1, 9, 5};
  int sum = SumAll(numbers);
  printf("sum is: %d\n", sum);
  return EXIT_SUCCESS;
}

int SumAll(int a[5]) {
  int i, sum = 0;
  for (i = 0; i < 5; i++) {
    sum += a[i];
  }
  return sum;
}
```

- Problem: loss of generality/flexibility

Solution 2: Pass Size as Parameter

```c
// sums all elements of the array a
int SumAll(int a[], int size);

int main(int argc, char** argv) {
  int numbers[] = {9, 8, 1, 9, 5};
  int sum = SumAll(numbers, 5);
  printf("sum is: %d\n", sum);
  return EXIT_SUCCESS;
}

int SumAll(int a[], int size) {
  int i, sum = 0;
  for (i = 0; i < size; i++) {
    sum += a[i];
  }
  return sum;
}
```

arraysum.c

- Standard idiom in C programs!

Arrays: Call-by-what?

- Technical answer: a `T[]` array parameter is "promoted" to a pointer of type `T*`, and the *pointer* is passed by value
  - So it acts like a *call-by-reference* ***array*** – caller's array can be changed if callee modifies the array parameter elements
  - But it's really a *call-by-value* ***pointer*** – the callee's pointer parameter can be changed without affecting the caller's array
    - This is because `T[i]` is really `*(T+i)`. We aren't changing `T`!

```
void CopyArray(int src[], int dst[], int size) {
  int i;
  dst = src;  // doesn't copy the array, copies the address
  for (i = 0; i < size; i++) {
    dst[i] = src[i];  // copies source array to itself
  }
}
```

Array Parameters

- Array parameters are *actually* passed as pointers to the first array element
  - The `[]` syntax for parameter types is just for convenience
    - Use whichever best helps the reader

This code:

```
void F(int a[]);

int main( ... ) {
  int a[5];
  ...
  F(a);
  return EXIT_SUCCESS;
}

void F(int a[]) {
```

Equivalent to:

```
void F(int* a);

int main( ... ) {
  int a[5];
  ...
  F(&a[0]);
  return EXIT_SUCCESS;
}

void F(int* a) {
```

Returning an Array

- Local variables, including arrays, are allocated on the Stack
  - They "disappear" when a function returns!
- Can't safely return local arrays from functions
  - Can't return an array as a return value – why not?

```
int* CopyArray(int src[], int size) {
  int i, dst[size];   // OK in C99

  for (i = 0; i < size; i++) {
    dst[i] = src[i];
  }

  return dst;  // no compiler error, but wrong!
}
```

buggy_copyarray.c

Solution: Output Parameter

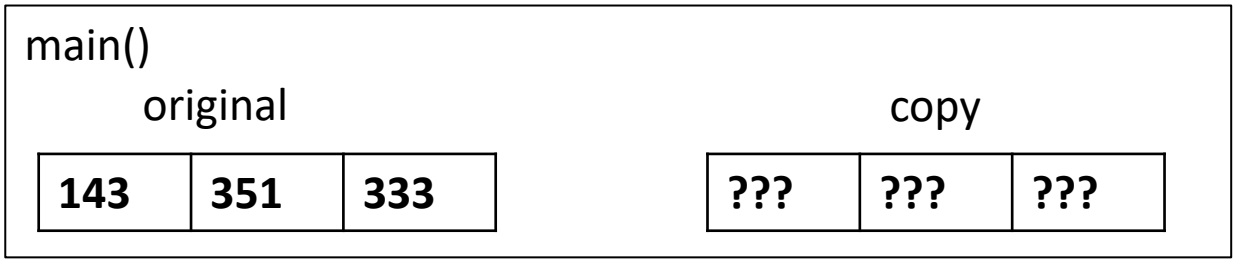
- Create the "returned" array in the caller
  - Pass it as an output parameter to `CopyArray()`
    - A pointer parameter that allows the called function to store values that the caller can use
  - Works because arrays are "passed" as pointers

```
void CopyArray(int src[], int dst[], int size) {
  int i;

  for (i = 0; i < size; i++) {
    dst[i] = src[i];
  }
}
```

copyarray.c

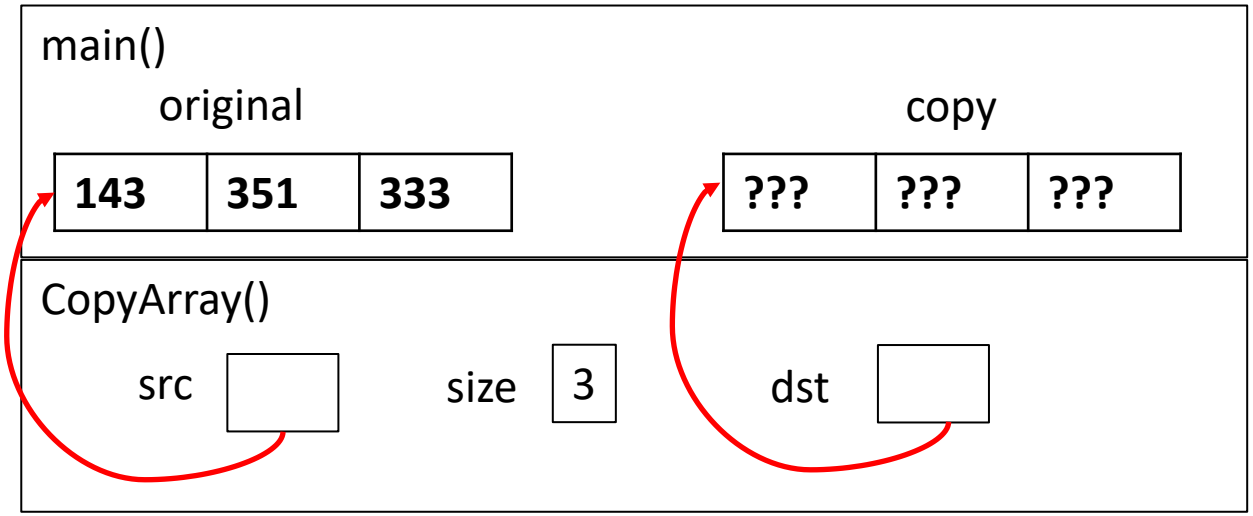
Array Memory Diagram



```
int main(){
  int original[] = {143, 351, 333};
  int copy[3];
  CopyArray(original, copy, 3);
}

void CopyArray(int src[], int dst[], int size) {
  for (int i = 0; i < size; i++) {
    dst[i] = src[i];
  }
}
```

Array Memory Diagram

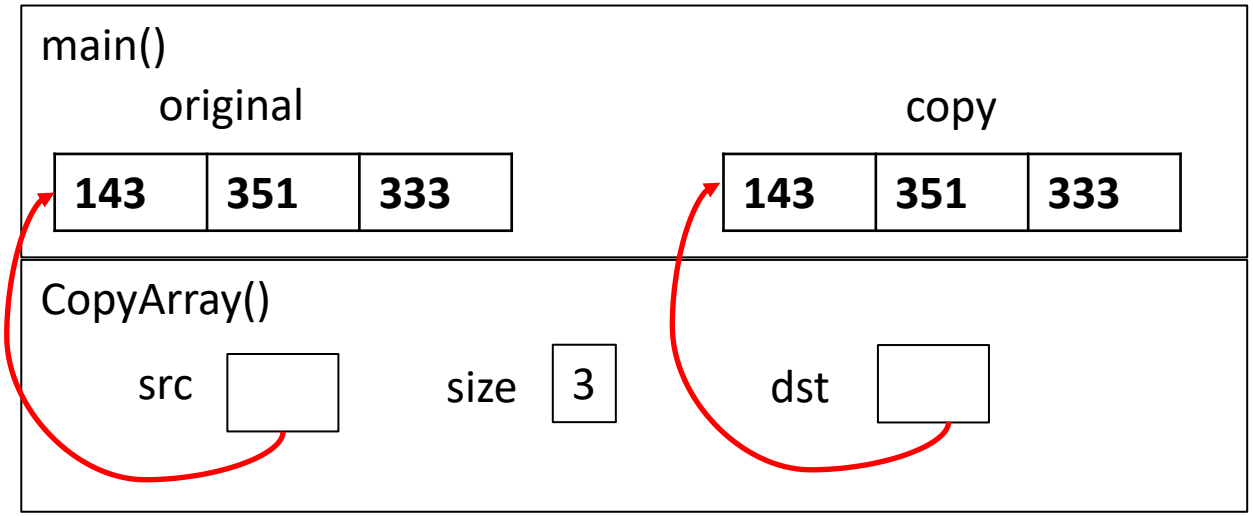


```
int main(){
  int original[] = {143, 351, 333};
  int copy[3];
  CopyArray(original, copy, 3);
}

void CopyArray(int src[], int dst[], int size) {
  for (int i = 0; i < size; i++) {
    dst[i] = src[i];
  }
}
```

`dst[i]` is really `*(dst+i)`. We aren't changing `dst`!

Array Memory Diagram



```
int main(){
  int original[] = {143, 351, 333};
  int copy[3];
  copyArray(original, copy, 3);
}

void CopyArray(int src[], int dst[], int size) {
  for (int i = 0; i < size; i++) {
    dst[i] = src[i];
  }
}
```

`dst[i]` is really `*(dst+i)`. We aren't changing `dst`!

Output Parameters

- Output parameters are common in library functions
  - `long int strtol(char* str, char** endptr, int base);`
  - `int sscanf(char* str, char* format, ...);`

```
int    num, i;
char* p_end, str1 = "333 rocks";
char   str2[10];

// converts "333 rocks" into long - p_end is conversion end
num = (int) strtol(str1, &p_end, 10);

// reads string into arguments based on format string
num = sscanf("3 blind mice", "%d %s", &i, str2);
```

outparam.c

Extra Exercises

- Some lectures contain "Extra Exercise" slides
  - Extra practice for you to do on your own without the pressure of being graded
  - You may use libraries and helper functions as needed
    - Early ones may require reviewing 351 material or looking at documentation for things we haven't discussed in 333 yet
  - Always good to provide test cases in `main()`

- Solutions for these exercises will be posted on the course website
  - You will get the most benefit from implementing your own solution before looking at the provided one

Extra Exercise #1

- Write a function that:
  - Accepts an array of 32-bit unsigned integers and a length
  - Reverses the elements of the array in place
  - Returns nothing (`void`)

Extra Exercise #2

- Use a box-and-arrow diagram for the following program and explain what it prints out:

```
#include <stdio.h>

int foo(int* bar, int** baz) {
  *bar = 5;
  *(bar+1) = 6;
  *baz = bar + 2;
  return *((*baz)+1);
}

int main(int argc, char** argv) {
  int arr[4] = {1, 2, 3, 4};
  int* ptr;

  arr[0] = foo(&arr[0], &ptr);
  printf("%d %d %d %d %d\n",
         arr[0], arr[1], arr[2], arr[3], *ptr);
  return 0;
}
```

Extra Exercise #3

- Write a program that determines and prints out whether the computer it is running on is little-endian or big-endian.
  - Hint: `show_bytes.c` from 351 Lecture 3
