## CSE 341 — Haskell Mini-Exercises # 2

These are questions for discussion in class. (You don't need to hand in anything.) The solutions are on the class web page.

1. Suppose that we have the following definition of the member function in Haskell:

Circle each type declaration that is a correct type for member. (Not necessarily the most general type, just a correct one.)

```
member :: Integer -> Integer -> Bool

member :: (Ord a) => a -> [a] -> Bool

member :: (Integer -> Integer) -> [Integer -> Integer] -> Bool

member :: (Eq a) => a -> [a] -> Bool

member :: a -> [a] -> Bool

member :: (Eq a) => [a] -> [[a]] -> Bool

member :: Bool -> [Bool] -> Bool
```

Which of the above types, if any, is the most general type for member?

2. What are the first ten elements in the following list?

```
mystery = 1 : map (*2) mystery
```

3. Define a variable ints whose value is the infinite list of all integers. It should be ordered in such a way that you can find any given integer after searching a finite number of elements in ints. In other words, this isn't going to work:

```
ints = [1 ..] ++ [-1, -2 ..]
```

- 4. The TypesNotes.hs lecture notes include a preorder function that does a pre-order traversal on the newly defined Tree datatype. Define inorder and postorder functions as well.
- 5. Write a Haskell type List that is like built-in lists, but defined from scratch.
- 6. Write a Haskell function append that works on instances of the List type. What is the type of this function?
- 7. Write a Haskell function mymap, like the built in map but that works on instances of the List type. What is the type of this function?

- 8. Write a Haskell action capitalize that reads in a line of text and prints it out in all capitals. (Hint: use the function Data.Char.toUpper.)
- 9. Convert the following functions into equivalent ones that don't use do:

```
printsqrt2 = do
  putStr "the square root of 2 is "
  putStrLn (show (sqrt 2))

calcsqrt = do
  x <- readLn
  putStrLn "calculating the square root of x"
  putStrLn (show (sqrt x))</pre>
```
