Course Motivation
(Do you think I forgot? 😊)

- Why learn the fundamental concepts that appear in all (most?) languages?
- Why use languages quite different from C, C++, Java, Python?
- Why focus on functional programming?
- Why use ML, Racket, and Ruby in particular?
- Not: Language X is better than Language Y

[You won’t be tested on this stuff]

Summary

- No such thing as a “best” PL
- Fundamental concepts easier to teach in some (multiple) PLs
- A good PL is a relevant, elegant interface for writing software
  - There is no substitute for precise understanding of PL semantics
- Functional languages have been on the leading edge for decades
  - Ideas have been absorbed by the mainstream, but very slowly
  - First-class functions and avoiding mutation increasingly essential
  - Meanwhile, use the ideas to be a better C/Java/PHP hacker
- Many great alternatives to ML, Racket, and Ruby, but each was chosen for a reason and for how they complement each other

What is the best kind of car?

What is the best kind of shoes?

Cars / Shoes

Cars are used for rather different things:
- Winning a Formula 1 race
- Taking kids to soccer practice
- Off-roading
- Hauling a mattress
- Getting the wind in your hair
- Staying dry in the rain

Shoes:
- Playing basketball
- Going to a formal
- Going to the beach

More on cars

- A good mechanic might have a specialty, but also understands how “cars” (not a particular make/model) work
  - The upholstery color isn’t essential (syntax)
- A good mechanical engineer really knows how cars work, how to get the most out of them, and how to design better ones
  - I don’t have a favorite kind of car or a favorite PL
- To learn how car pieces interact, it may make sense to start with a classic design rather than the latest model
  - A popular car may not be best
  - May especially not be best for learning how cars work
Why semantics and idioms

This course focuses as much as it can on semantics and idioms

• Correct reasoning about programs, interfaces, and compilers requires a precise knowledge of semantics
  – Not “I feel that conditional expressions might work like this”
  – Not “I like curly braces more than parentheses”
  – Much of software development is designing precise interfaces; what a PL means is a really good example

• Idioms make you a better programmer
  – Best to see in multiple settings, including where they shine
  – See Java in a clearer light even if I never show you Java

Idioms make you a better programmer

All cars are the same

• To make it easier to rent cars, it is great that they all have steering wheels, brakes, windows, headlights, etc.
  – Yet it is still uncomfortable to learn a new one
  – Can you be a great driver if you only ever drive one car?

• And maybe PLs are more like cars, trucks, boats, and bikes
• So are all PLs really the same…

Are all languages the same?

Yes:
  – Any input-output behavior implementable in language X is implementable in language Y [Church-Turing thesis]
  – Java, ML, and a language with one loop and three infinitely-large integers are “the same”

Yes:
  – Same fundamentals reappear: variables, abstraction, one-of types, recursive definitions, …

No:
  – The human condition vs. different cultures
    (travel to learn more about home)
  – The primitive/default in one language is awkward in another
  – Beware “the Turing tarpit”

Functional Programming

Why spend 60-80% of course using functional languages:
  – Mutation is discouraged
  – Higher-order functions are very convenient
  – One-of types via constructs like datatypes

Because:
  1. These features are invaluable for correct, elegant, efficient software (great way to think about computation)
  2. Functional languages have always been ahead of their time
  3. Functional languages well-suited to where computing is going

Most of course is on (1), so a few minutes on (2) and (3) …

Ahead of their time

All these were dismissed as “beautiful, worthless, slow things PL professors make you learn”

• Garbage collection (Java didn’t exist in 1995, PL courses did)
• Generics (List<T> in Java, C#), much more like SML than C++
• XML for universal data representation (like Racket/Scheme/LISP/…)
• Higher-order functions (Ruby, Javascript, C#, now Java, …)
• Type inference (C#, Scala, …)
• Recursion (a big fight in 1960 about this – I’m told ☺)
• …
The future may resemble the past

Somehow nobody notices we are right… 20 years later

• “To conquer” versus “to assimilate”
• Societal progress takes time and muddles “taking credit”
• Maybe pattern-matching, currying, hygienic macros, etc. will be next

Recent-ish Surge, Part 1

Other popular functional PLs (alphabetized, pardon omissions)
• Clojure http://clojure.org
• Erlang http://www.erlang.org
• F# http://tryfsharp.org
• Haskell http://www.haskell.org
• OCaml http://ocaml.org
• Scala http://www.scala-lang.org

Some “industry users” lists (surely more exist):
• http://www.haskell.org/haskellwiki/Haskell_in_industry
• http://ocaml.org/companies.html
• In general, see http://cufp.org

Recent-ish Surge, Part 2

Popular adoption of concepts:
• C#, LINQ (closures, type inference, …)
• Java 8 (closures)
• MapReduce / Hadoop
  – Avoiding side-effects essential for fault-tolerance here
• Scala libraries (e.g., Akka, …)
• …

Why a surge?

My best guesses:
• Concise, elegant, productive programming
• JavaScript, Python, Ruby helped break the Java/C/C++ hegemony
• Avoiding mutation is the easiest way to make concurrent and parallel programming easier
  – In general, to handle sharing in complex systems
• Sure, functional programming is still a small niche, but there is so much software in the world today even niches have room

The languages together

SML, Racket, and Ruby are a useful combination for us

<table>
<thead>
<tr>
<th></th>
<th>dynamically typed</th>
<th>statically typed</th>
</tr>
</thead>
<tbody>
<tr>
<td>functional</td>
<td>Racket</td>
<td>SML</td>
</tr>
<tr>
<td>object-oriented</td>
<td>Ruby</td>
<td>Java</td>
</tr>
</tbody>
</table>

ML: polymorphic types, pattern-matching, abstract types & modules
Racket: dynamic typing, “good” macros, minimalist syntax, eval
Ruby: classes but not types, very OOP, mixins [and much more]

Really wish we had more time:
Haskell: laziness, purity, type classes, monads
Prolog: unification and backtracking [and much more]

But why not…

Instead of SML, could use similar languages easy to learn after:

– OCaml: yes indeed but would have to port all my materials ☹
  • And a few small things (e.g., second-class constructors)
– F#: yes and very cool, but needs a .Net platform
  • And a few more small things (e.g., second-class constructors, less elegant signature-matching)
– Haskell: more popular, cooler types, but lazy semantics and type classes from day 1

Admittedly, SML and its implementations are showing their age (e.g., andal.so and less tool support), but it still makes for a fine foundation in statically typed, eager functional programming
**But why not…**

Instead of Racket, could use similar languages easy to learn after:

– Scheme, Lisp, Clojure, …

Racket has a combination of:

– A modern feel and active evolution
– “Better” macros, modules, structs, contracts, …
– A large user base and community (not just for education)
– An IDE tailored to education

Could easily define our own language in the Racket system
– Would rather use a good and vetted design

**But why not…**

Instead of Ruby, could use another language:

• Python, Perl, JavaScript are also dynamically typed, but are not as “fully” OOP, which is what I want to focus on
  – Python also does not have (full) closures
  – JavaScript also does not have classes but is OOP

• Smalltalk serves my OOP needs
  – But implementations merge language/environment
  – Less modern syntax, user base, etc.

**Is this real programming?**

• The way we use ML/Racket/Ruby can make them seem almost “silly” precisely because lecture and homework focus on interesting language constructs

• “Real” programming needs file I/O, string operations, floating-point, graphics, project managers, testing frameworks, threads, build systems, …
  – Many elegant languages have all that and more
  • Including Racket and Ruby
  – If we used Java the same way, Java would seem “silly” too

**A note on reality**

Reasonable questions when deciding to use/learn a language:

• What libraries are available for reuse?
• What tools are available?
• What can get me a job?
• What does my boss tell me to do?
• What is the de facto industry standard?
• What do I already know?

Our course by design does not deal with these questions
  – You have the rest of your life for that
  – And technology leaders affect the answers
