### Introduction to Data Management CSE 344

#### Lectures 10-11: System's Architecture and Relational Algebra

### Announcements

• Webquiz 3 due tonight!

• Today's lecture: 2.4 and 5.1

### Where We Are

- Motivation for using a DBMS for managing data
- SQL, SQL, SQL
  - Declaring the schema for our data (CREATE TABLE)
  - Inserting data one row at a time or in bulk (INSERT/.import)
  - Modifying the schema and updating the data (ALTER/UPDATE)
  - Querying the data (SELECT)
  - Tuning queries (CREATE INDEX)
- Next step: More knowledge of how DBMSs work
  - Client-server architecture
  - Relational algebra and query execution

CSE 344 - Winter 2013

### Architectures

1. Serverless

2. Two tier: client/server

3. Three tier: client/app-server/db-server

### **Client-Server**

- One server running the database
- Many clients, connecting via the ODBC or JDBC (Java Database Connectivity) protocol

### **Client-Server**

- One *server* that runs the DBMS (or RDBMS):
  - Your own desktop, or
  - Some beefy system, or
  - A cloud service (SQL Azure)
- Many *clients* run apps and connect to DBMS
  - Microsoft's Management Studio (for SQL Server), or
  - psql (for postgres)
  - Some Java program (HW5) or some C++ program
- Clients "talk" to server using JDBC/ODBC protocol

Web-based applications

### **DBMS Deployment: Cloud**

### Using a DBMS Server

- 1. Client application establishes connection to server
- 2. Client must authenticate self
- 3. Client submits SQL commands to server
- 4. Server executes commands and returns results

### The WHAT and the HOW

- SQL = WHAT we want to get form the data
- Relational Algebra = HOW to get the data we want
- The passage from WHAT to HOW is called query optimization

### Overview: SQL = WHAT

Product(<u>pid</u>, name, price) Purchase(<u>pid, cid</u>, store)

Customer(<u>cid</u>, name, city)

SELECT DISTINCT x.name, z.name FROM Product x, Purchase y, Customer z WHERE x.pid = y.pid and y.cid = y.cid and x.price > 100 and z.city = 'Seattle'

It's clear WHAT we want, unclear HOW to get it

![](_page_14_Figure_0.jpeg)

### **Relational Algebra**

### Sets v.s. Bags

- Sets: {a,b,c}, {a,d,e,f}, { }, . . .
- Bags: {a, a, b, c}, {b, b, b, b}, . . .

Relational Algebra has two semantics:

- Set semantics = standard Relational Algebra
- Bag semantics = extended Relational Algebra

### **Relational Algebra Operators**

- Union U, intersection ∩, difference -
- Selection o
- Projection
- Cartesian product ×, join ⋈
- Rename p
- Duplicate elimination  $\delta$
- Grouping and aggregation γ
- Sorting  $\tau$

Extended RA

RA

### **Union and Difference**

![](_page_18_Picture_1.jpeg)

What do they mean over bags?

### What about Intersection ?

Derived operator using minus

$$R1 \cap R2 = R1 - (R1 - R2)$$

• Derived using join (will explain later)

$$R1 \cap R2 = R1 \bowtie R2$$

### Selection

• Returns all tuples which satisfy a condition  $\sigma_c(R)$ 

• Examples

$$-\sigma_{\text{Salary} > 40000}$$
 (Employee)

- $\sigma_{\text{name = "Smith"}}$  (Employee)
- The condition c can be =, <,  $\leq$ ,  $\geq$ ,  $\geq$ , <>

# Employee

SSN	Name	Salary
1234545	John	200000
5423341	Smith	600000
4352342	Fred	500000

#### $\sigma_{\text{Salary} > 40000}$ (Employee)

SSN	Name	Salary
5423341	Smith	600000
4352342	Fred	500000

### Projection

Eliminates columns

$$\Pi_{A1,\ldots,An}(\mathsf{R})$$

- Example: project social-security number and names:
  - $\Pi_{SSN, Name}$  (Employee)
  - Answer(SSN, Name)

Different semantics over sets or bags! Why?

## Employee

SSN	Name	Salary
1234545	John	20000
5423341	John	60000
4352342	John	20000

#### $\Pi_{\text{Name,Salary}}$ (Employee)

Name	Salary	Name	Salary
John	20000	John	20000
John	60000	John	60000
John	20000		

#### **Bag semantics**

Set semantics

Which is more efficient?

### **Composing RA Operators**

#### Patient

no	name	zip	disease
1	p1	98125	flu
2	p2	98125	heart
3	р3	98120	lung
4	p4	98120	heart

 $\pi_{zip,disease}$ (Patient)

zip	disease
98125	flu
98125	heart
98120	lung
98120	heart

 $\pi_{zip} \left( \sigma_{disease='heart'} (Patient) \right)$ 

	zip
I	98120
Ĩ	98125

 $\sigma_{disease='heart'}(Patient)$ 

no	name	zip	disease
2	p2	98125	heart
4	p4	98120	heart

### **Cartesian Product**

• Each tuple in R1 with each tuple in R2

![](_page_25_Picture_2.jpeg)

Rare in practice; mainly used to express joins

### **Cross-Product Example**

#### Employee

Name	SSN
John	999999999
Tony	77777777

#### Dependent

EmpSSN	DepName
9999999999	Emily
77777777	Joe

#### **Employee** × **Dependent**

Name	SSN	EmpSSN	DepName
John	999999999	999999999	Emily
John	999999999	77777777	Joe
Tony	77777777	999999999	Emily
Tony	77777777	77777777	Joe

### Renaming

• Changes the schema, not the instance

- Example:
  - $ρ_{N, S}$ (Employee) → Answer(N, S)

Not really used by systems, but needed on paper

### Natural Join

![](_page_28_Picture_1.jpeg)

- Meaning:  $R1 \bowtie R2 = \Pi_A(\sigma(R1 \times R2))$
- Where:
  - Selection  $\sigma$  checks equality of all common attributes
  - Projection eliminates duplicate common attributes

CSE 344 - Winter 2013

### **Natural Join Example**

S

Α	В
Х	Y
Х	Z
Y	Z
Z	V

 B
 C

 Z
 U

 V
 W

 Z
 V

	Α	В	С
<b>R</b> ⋈ <b>S</b> =	Х	Z	U
$\Pi_{ABC}(\sigma_{R.B=S.B}(R\timesS))$	Х	Z	V
	Y	Z	U
	Y	Z	V
	Z	V	W

CSE 344 - Winter 2013

### Natural Join Example 2

#### AnonPatient P

age	zip	disease
54	98125	heart
20	98120	flu

Voters V

name	age	zip
p1	54	98125
p2	20	98120

 $\mathsf{P} \bowtie \mathsf{V}$ 

age	zip	disease	name
54	98125	heart	p1
20	98120	flu	p2

### Natural Join

 Given schemas R(A, B, C, D), S(A, C, E), what is the schema of R ⋈ S ?

• Given R(A, B, C), S(D, E), what is  $R \bowtie S$ ?

• Given R(A, B), S(A, B), what is  $R \bowtie S$ ?

### Theta Join

• A join that involves a predicate

$$R1 \bowtie_{\theta} R2 = \sigma_{\theta} (R1 \times R2)$$

- Here  $\theta$  can be any condition
- For our voters/disease example:

$$\mathsf{P} \Join \mathsf{P}_{\mathsf{P},\mathsf{zip}} = \mathsf{V}_{\mathsf{zip}}$$
 and  $\mathsf{P}_{\mathsf{age}} < \mathsf{V}_{\mathsf{age}} + 5$  and  $\mathsf{P}_{\mathsf{age}} > \mathsf{V}_{\mathsf{age}} - 5$  V

### Equijoin

• A theta join where  $\theta$  is an equality

$$R1 \bowtie_{A=B} R2 = \sigma_{A=B} (R1 \times R2)$$

• This is by far the most used variant of join in practice

### Equijoin Example

#### AnonPatient P

age	zip	disease
54	98125	heart
20	98120	flu

Voters V

name	age	zip
p1	54	98125
p2	20	98120

P⊠<sub>P.age=V.age</sub> V

age	P.zip	disease	name	V.zip
54	98125	heart	p1	98125
20	98120	flu	p2	98120

### Join Summary

• Theta-join:  $R \bowtie_{\theta} S = \sigma_{\theta}(R \times S)$ 

– Join of R and S with a join condition  $\boldsymbol{\theta}$ 

– Cross-product followed by selection  $\boldsymbol{\theta}$ 

- Equijoin:  $R_{\bowtie_{\theta}}S = \pi_{A}(\sigma_{\theta}(R \times S))$ 
  - Join condition  $\boldsymbol{\theta}$  consists only of equalities
  - Projection  $\pi_A$  drops all redundant attributes
- Natural join:  $R \bowtie S = \pi_A (\sigma_{\theta}(R \times S))$ 
  - Equijoin
  - Equality on **all** fields with same name in R and in S

### So Which Join Is It?

 When we write R ⋈ S we usually mean an equijoin, but we often omit the equality predicate when it is clear from the context

### More Joins

#### Outer join

- Include tuples with no matches in the output
- Use NULL values for missing attributes
- Variants
  - Left outer join
  - Right outer join
  - Full outer join

### **Outer Join Example**

#### AnonPatient P

age	zip	disease
54	98125	heart
20	98120	flu
33	98120	lung

#### AnnonJob J

job	age	zip
lawyer	54	98125
cashier	20	98120

age	zip	disease	job
54	98125	heart	lawyer
20	98120	flu	cashier
33	98120	lung	null

$$\mathsf{P}\ltimes\mathsf{V}$$

### Some Examples

Supplier(sno,sname,scity,sstate)
Part(pno,pname,psize,pcolor)
Supply(sno,pno,qty,price)

Q2: Name of supplier of parts with size greater than 10  $\pi_{sname}$ (Supplier  $\bowtie$  Supply  $\Join(\sigma_{psize>10}$  (Part))

Q3: Name of supplier of red parts or parts with size greater than 10  $\pi_{sname}(Supplier \bowtie Supply \bowtie (\sigma_{psize>10} (Part) \cup \sigma_{pcolor='red'} (Part)))$ 

### From SQL to RA

### From SQL to RA

Product(<u>pid</u>, name, price) Purchase(<u>pid</u>, <u>cid</u>, store) Customer(<u>cid</u>, name, city)

> SELECT DISTINCT x.name, z.name FROM Product x, Purchase y, Customer z WHERE x.pid = y.pid and y.cid = y.cid and x.price > 100 and z.city = 'Seattle'

### From SQL to RA

![](_page_42_Figure_1.jpeg)

### An Equivalent Expression

![](_page_43_Figure_1.jpeg)

## Extended RA: Operators on Bags

- Duplicate elimination  $\boldsymbol{\delta}$
- Grouping γ
- Sorting  $\tau$

### Logical Query Plan

![](_page_45_Figure_1.jpeg)

![](_page_46_Figure_0.jpeg)

![](_page_47_Figure_0.jpeg)

### How about Subqueries?

```
SELECT Q.sno
FROM Supplier Q
WHERE Q.sstate = 'WA'
and not exists
(SELECT *
FROM Supply P
WHERE P.sno = Q.sno
and P.price > 100)
```

### How about Subqueries?

![](_page_49_Figure_2.jpeg)

### How about Subqueries?

SELECT Q.sno FROM Supplier Q WHERE Q.sstate = 'WA' and not exists (SELECT \* FROM Supply P WHERE P.sno = Q.sno and P.price > 100)

De-Correlation

SELECT Q.sno FROM Supplier Q WHERE Q.sstate = 'WA' and Q.sno not in (SELECT P.sno FROM Supply P WHERE P.price > 100)

### How about Subqueries?

![](_page_51_Figure_2.jpeg)

### How about Subqueries?

![](_page_52_Figure_2.jpeg)

### From Logical Plans to Physical Plans

Supplier(<u>sid</u>, sname, scity, sstate) Supply(<u>sid, pno</u>, quantity)

Example

SELECT sname FROM Supplier x, Supply y WHERE x.sid = y.sid and y.pno = 2 and x.scity = 'Seattle' and x.sstate = 'WA'

Give a relational algebra expression for this query

Supplier(<u>sid</u>, sname, scity, sstate) Supply(<u>sid</u>, pno, quantity)

### **Relational Algebra**

 $\pi_{\text{sname}}(\sigma_{\text{scity='Seattle'} \land \text{sstate='WA'} \land \text{pno=2}} (\text{Supplier} \Join))$ 

![](_page_56_Figure_0.jpeg)

Supplier(sid, sname, scity, sstate)

Supply(sid, pno, quantity)

### Physical Query Plan 1

![](_page_57_Figure_3.jpeg)

A physical query plan is a logical query plan annotated with physical implementation details Supplier(<u>sid</u>, sname, scity, sstate) Supply(<u>sid, pno</u>, quantity) Physical Query Plan 2

![](_page_58_Figure_1.jpeg)

CSE 344 - Winter 2013

![](_page_59_Figure_0.jpeg)

### Physical Data Independence

- Means that applications are insulated from changes in physical storage details
  - E.g., can add/remove indexes without changing apps
  - Can do other physical tunings for performance
- SQL and relational algebra facilitate physical data independence because both languages are "set-at-a-time": Relations as input and output
