Introduction to Data Management CSE 344

Lecture 24: Transactions

Announcements

Webquiz due on Monday

Homework due on Wednesday

Where We Are?

Last time: all about SQLite

Today SQL Server (and other)

Lock-Based Scheduler

Simple idea:

- Each element has a unique lock
- Each transaction must first acquire the lock before reading/writing that element
- If lock is held by another transaction, then wait
- The transaction must release the lock(s)

Notation

 $L_i(A)$ = transaction T_i acquires lock for element A

 $U_i(A)$ = transaction T_i releases lock for element A

A Non-Serializable Schedule

T1 T2 READ(A) A := A + 100WRITE(A) READ(A) A := A*2WRITE(A) READ(B) B := B*2WRITE(B) READ(B) B := B + 100WRITE(B)

Example

T1 T2 $L_1(A)$; READ(A) A := A + 100WRITE(A); $U_1(A)$; $L_1(B)$ $L_2(A)$; READ(A) A := A*2WRITE(A); $U_2(A)$; $L_2(B)$; DENIED... READ(B) B := B + 100WRITE(B); $U_1(B)$; ...GRANTED; READ(B) B := B*2WRITE(B); $U_2(B)$;

Scheduler has ensured a conflict-serializable schedule

But...

```
T2
T1
L_1(A); READ(A)
A := A + 100
WRITE(A); U_1(A);
                             L_2(A); READ(A)
                             A := A*2
                             WRITE(A); U_2(A);
                             L_2(B); READ(B)
                             B := B*2
                             WRITE(B); U_2(B);
L_1(B); READ(B)
B := B + 100
WRITE(B); U_1(B);
```

Locks did not enforce conflict-serializability !!! What's wrong?

Two Phase Locking (2PL)

The 2PL rule:

In every transaction, all lock requests must precede all unlock requests

Example: 2PL transactions

```
T2
L_1(A); L_1(B); READ(A)
A := A + 100
WRITE(A); U_1(A)
                              L_2(A); READ(A)
                              A := A*2
                              WRITE(A);
                              L_2(B); DENIED...
READ(B)
B := B + 100
WRITE(B); U_1(B);
                               ...GRANTED; READ(B)
                              B := B*2
                              WRITE(B); U_2(A); U_2(B);
```

Now it is conflict-serializable

A New Problem: Non-recoverable Schedule

```
T1
                                    T2
L_1(A); L_1(B); READ(A)
A := A + 100
WRITE(A); U_1(A)
                                    L_2(A); READ(A)
                                    A := A*2
                                    WRITE(A);
                                    L_2(B); DENIED...
READ(B)
B := B + 100
WRITE(B); U_1(B);
                                    ...GRANTED; READ(B)
                                    B := B*2
                                    WRITE(B); U_2(A); U_2(B);
                                    Commit
```

Rollback

Strict 2PL

The Strict 2PL rule:

All locks are held until the transaction commits or aborts.

With strict 2PL, we will get schedules that are both conflict-serializable and recoverable

Strict 2PL

```
T1
                                          T2
L<sub>1</sub>(A); READ(A)
A := A + 100
WRITE(A);
                                          L_2(A); DENIED...
L_1(B); READ(B)
B := B + 100
WRITE(B);
U_1(A), U_1(B);
                                           ...GRANTED; READ(A)
Rollback
                                          A := A*2
                                          WRITE(A);
                                          L_2(B); READ(B)
                                          B := B*2
                                          WRITE(B); U_2(A); U_2(B);
                                          Commit
                                                                               13
```

Deadlocks

- T₁ waits for a lock held by T₂;
- T₂ waits for a lock held by T₃;
- T₃ waits for
- •
- T_n waits for a lock held by T₁

SQL Lite: there is only one exclusive lock; thus, never deadlocks

SQL Server: checks periodically for deadlocks and aborts one TXN

Lock Modes

- S = shared lock (for READ)
- X = exclusive lock (for WRITE)

Lock compatibility matrix:

None S X

None	S	X
OK	OK	OK
OK	OK	Conflict
OK	Conflict	Conflict

```
-- Run this on SQL Server create table r(a int primary key, b int); insert into r values (1,10); insert into r values (2,20); insert into r values (3,30);
```

-- Run the following in two different query windows:

```
begin transaction;
update r set b=11 where a=1;
-- T1 has exclusive lock on element a=1

T2:
set transaction isolation level serializable;
begin transaction;
update r set b=21 where a=2;
-- T2 has exclusive lock on element a=2
```

set transaction isolation level serializable;

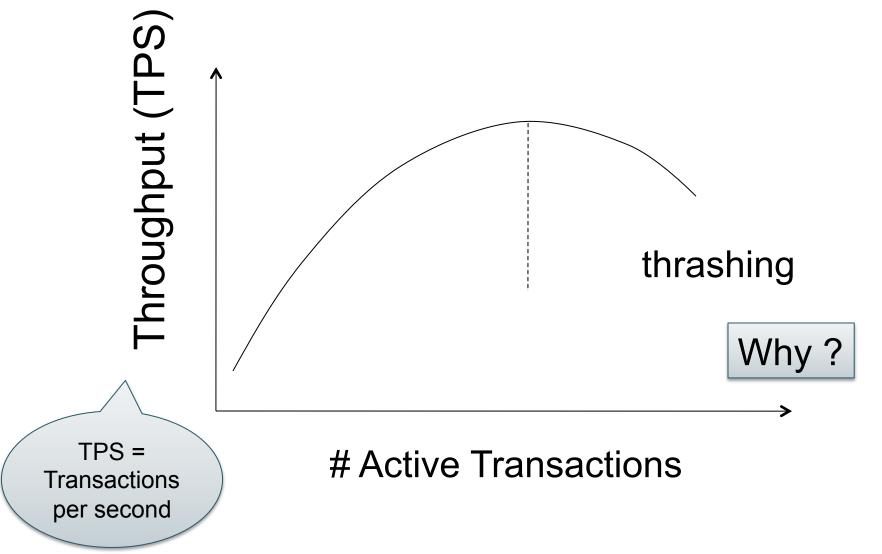

T1:

```
T1:
 select * from r where a=1 or a=3;
 -- T1 has shared lock on a=3
T2.
 select * from r where a=2 or a=3;
 -- T2 has shared lock on a=3
T1:
 select * from r;
 -- what happens now? and why?
T2:
 select * from r;
 -- what happens now? and why?
T1/T2:
 commit; // As needed
```

Lock Granularity

- Fine granularity locking (e.g., tuples)
 - High concurrency
 - High overhead in managing locks
 - E.g. SQL Server
- Coarse grain locking (e.g., tables, entire database)
 - Many false conflicts
 - Less overhead in managing locks
 - E.g. SQL Lite

Lock Performance

 So far we have assumed the database to be a static collection of elements (=tuples)

 If tuples are inserted/deleted then the phantom problem appears

T1 T2

SELECT *
FROM Product
WHERE color='blue'

INSERT INTO Product(name, color) VALUES ('gizmo', 'blue')

SELECT *
FROM Product
WHERE color='blue'

Suppose there are two blue products, A1, A2:

Is this schedule serializable?

T1 T2

SELECT *
FROM Product
WHERE color='blue'

INSERT INTO Product(name, color) VALUES ('gizmo', 'blue')

SELECT *
FROM Product
WHERE color='blue'

Suppose there are two blue products, A1, A2:

Is this schedule serializable?

NO: T1: sees 2 products the first time, then sees 3 products the second time

T1 T2

SELECT *
FROM Product
WHERE color='blue'

INSERT INTO Product(name, color) VALUES ('gizmo', 'blue')

SELECT *
FROM Product
WHERE color='blue'

Suppose there are two blue products, A1, A2:

R1(A1),R1(A2),W2(A3),R1(A1),R1(A2),R1(A3)

T1 T2

SELECT *
FROM Product
WHERE color='blue'

INSERT INTO Product(name, color) VALUES ('gizmo', 'blue')

SELECT *
FROM Product
WHERE color='blue'

When seen as a sequence of R/W, the schedule appears serializable. Locks *cannot* prevent this schedule.

Suppose there are two blue products, A1, A2:

R1(A1),R1(A2),W2(A3),R1(A1),R1(A2),R1(A3)

W2(A3),R1(A1),R1(A2),R1(A1),R1(A2),R1(A3)

 A "phantom" is a tuple that is invisible during part of a transaction execution but not invisible during the entire execution

- In our example:
 - T1: reads list of products
 - T2: inserts a new product
 - T1: re-reads: a new product appears!

Dealing With Phantoms

- Lock the entire table, or
- Lock the index entry for 'blue'
 - If index is available
- Or use predicate locks
 - A lock on an arbitrary predicate

Dealing with phantoms is expensive!

Isolation Levels in SQL

1. "Dirty reads"
SET TRANSACTION ISOLATION LEVEL READ UNCOMMITTED

- 2. "Committed reads"

 SET TRANSACTION ISOLATION LEVEL READ COMMITTED
- 3. "Repeatable reads"

 SET TRANSACTION ISOLATION LEVEL REPEATABLE READ
- 4. Serializable transactions

 SET TRANSACTION ISOLATION LEVEL SERIALIZABLE

1. Isolation Level: Dirty Reads

- "Long duration" WRITE locks
 - Strict 2PL
- No READ locks
 - Read-only transactions are never delayed

Possible pbs: dirty and inconsistent reads

2. Isolation Level: Read Committed

- "Long duration" WRITE locks
 - Strict 2PL
- "Short duration" READ locks
 - Only acquire lock while reading (not 2PL)

Unrepeatable reads
When reading same element twice,
may get two different values

3. Isolation Level: Repeatable Read

- "Long duration" WRITE locks
 - Strict 2PL
- "Long duration" READ locks
 - Strict 2PL

This is not serializable yet !!!

4. Isolation Level Serializable

- "Long duration" WRITE locks
 - Strict 2PL
- "Long duration" READ locks
 - Strict 2PL
- Predicate locking
 - To deal with phantoms

Beware!

In commercial DBMSs:

- Default level is often NOT serializable
- Default level differs between DBMSs
- Some engines support subset of levels!
- Serializable may not be exactly ACID
- Also, some DBMSs do NOT use locking and different isolation levels can lead to different pbs
- Bottom line: Read the doc for your DBMS!
