Introduction to Data Management
CSE 344

Lecture 6: Nested Queries in SQL
Announcements

• Webquiz 2 is out
  – Due next Tuesday

• Homework 2 is out
  – Get to play with a REAL database (IMDB)
  – Due next Thursday
Lecture Goals

• Today we will learn how to write (even) more powerful SQL queries

• Reading: Ch. 6.3
Subqueries

- A subquery is a SQL query nested inside a larger query.
- Such inner-outer queries are called nested queries.
- A subquery may occur in:
  - A SELECT clause
  - A FROM clause
  - A WHERE clause
- Rule of thumb: avoid writing nested queries when possible; keep in mind that sometimes it’s impossible.
Subqueries…

• Can return a single constant and this constant can be compared with another value in a WHERE clause
• Can return relations that can be used in various ways in WHERE clauses
• Can appear in FROM clauses, followed by a tuple variable that represents the tuples in the result of the subquery
• Can appear as computed values in a SELECT clause
1. Subqueries in SELECT

Product (pname, price, cid)
Company(cid, cName, city)

For each product return the city where it is manufactured
1. Subqueries in SELECT

Product (pname, price, cid)  
Company(cid, cname, city)

For each product return the city where it is manufactured

```
SELECT X.pname, (SELECT Y.city FROM Company Y WHERE Y.cid=X.cid) as City
FROM Product X
```
1. Subqueries in SELECT

Product (pname, price, cid)
Company(cid, cname, city)

For each product return the city where it is manufactured

```
SELECT X.pname, (SELECT Y.city
FROM Company Y
WHERE Y.cid=X.cid) as City
FROM Product X
```

What happens if the subquery returns more than one city?
We get a runtime error
1. Subqueries in SELECT

Product (pname, price, cid)
Company (cid, cname, city)

For each product return the city where it is manufactured

```
SELECT X.pname, (SELECT Y.city
   FROM Company Y
   WHERE Y.cid=X.cid) as City
FROM   Product X
```

What happens if the subquery returns more than one city?
We get a runtime error
1. Subqueries in SELECT

Product (pname, price, cid)
Company (cid, cname, city)

For each product return the city where it is manufactured

```
SELECT X.pname, (SELECT Y.city
               FROM Company Y
               WHERE Y.cid=X.cid) as City
FROM Product X
```

What happens if the subquery returns more than one city?
We get a runtime error
1. Subqueries in SELECT

Product (pname, price, cid)
Company(cid, cname, city)

For each product return the city where it is manufactured

```
SELECT X.pname, (SELECT Y.city
FROM Company Y
WHERE Y.cid=X.cid) as City
FROM Product X
```

What happens if the subquery returns more than one city?
We get a runtime error
(SQLite simply ignores the extra values)
Whenever possible, don’t use a nested queries:

```sql
SELECT X.pname, (SELECT Y.city FROM Company Y WHERE Y.cid=X.cid) as City
FROM Product X
```

```
SELECT X.pname, Y.city
FROM Product X, Company Y
WHERE X.cid=Y.cid
```
1. Subqueries in SELECT

Whenever possible, don’t use a nested queries:

```
SELECT X.pname, (SELECT Y.city
   FROM Company Y
   WHERE Y.cid=X.cid) as City
FROM   Product X
```

```
SELECT X.pname, Y.city
FROM   Product X, Company Y
WHERE  X.cid=Y.cid
```
1. Subqueries in SELECT

Compute the number of products made by each company

```
SELECT DISTINCT C.cname, (SELECT count(*)
FROM Product P
WHERE P.cid=C.cid)
FROM Company C
```
1. Subqueries in SELECT

Compute the number of products made by each company

```
SELECT DISTINCT C.cname, (SELECT count(*)
    FROM Product P
    WHERE P.cid=C.cid)
FROM Company C
```

Better: we can unnest by using a GROUP BY

```
SELECT C.cname, count(*)
FROM Company C, Product P
WHERE C.cid=P.cid
GROUP BY C.cname
```
1. Subqueries in SELECT

But are these really equivalent?

```sql
SELECT DISTINCT C.cname, (SELECT count(*)
FROM Product P
WHERE P.cid=C.cid)
FROM Company C
```

```sql
SELECT C.cname, count(*)
FROM Company C, Product P
WHERE C.cid=P.cid
GROUP BY C.cname
```
1. Subqueries in SELECT

But are these really equivalent?

```
SELECT DISTINCT C.cname, (SELECT count(*)
FROM Product P
WHERE P.cid=C.cid)
FROM Company C
```

```
SELECT C.cname, count(*)
FROM Company C, Product P
WHERE C.cid=P.cid
GROUP BY C.cname
```

```
SELECT C.cname, count(pname)
FROM Company C LEFT OUTER JOIN Product P
ON C.cid=P.cid
GROUP BY C.cname
```

No! Different results if a company has no products.

Product (pname, price, cid)
Company(cid, cname, city)
2. Subqueries in FROM

Find all products whose prices is > 20 and < 500

```
SELECT X.pname
FROM (SELECT * FROM Product AS Y WHERE price > 20) as X
WHERE X.price < 500
```

Unnest this query!
2. Subqueries in FROM

• At the end of the lecture we will see that sometimes we really need a subquery and one option will be to put it in the FROM clause.
3. Subqueries in WHERE

Find all companies that make some products with price < 200
3. Subqueries in WHERE

Find all companies that make some products with price < 200
3. Subqueries in WHERE

Find all companies that make some products with price < 200

Using EXISTS:

```
SELECT DISTINCT C.cname
FROM Company C
WHERE EXISTS (SELECT *
               FROM Product P
               WHERE C.cid = P.cid AND P.price < 200)
```
3. Subqueries in WHERE

Find all companies that make some products with price < 200

Using **IN**

```
SELECT DISTINCT C.cname
FROM Company C
WHERE C.cid IN (SELECT P.cid
                 FROM Product P
                 WHERE P.price < 200)
```
3. Subqueries in WHERE

Find all companies that make some products with price < 200

Using ANY:

```
SELECT DISTINCT C.cname
FROM Company C
WHERE 200 > ANY (SELECT price
FROM Product P
WHERE P.cid = C.cid)
```
3. Subqueries in WHERE

Find all companies that make some products with price < 200

Using **ANY**:

```sql
SELECT DISTINCT C.cname
FROM Company C
WHERE 200 > ANY (SELECT price
                   FROM Product P
                   WHERE P.cid = C.cid)
```

Existential quantifiers are not supported in SQLite.
3. Subqueries in WHERE

Find all companies that make some products with price < 200

Now let’s unnest it:

```
SELECT DISTINCT C.cname
FROM Company C, Product P
WHERE C.cid= P.cid and P.price < 200
```
3. Subqueries in WHERE

Find all companies that make some products with price < 200

Existential quantifiers are easy!
Product (pname, price, cid)
Company(cid, cname, city)

3. Subqueries in WHERE

Find all companies s.t. all their products have price < 200

same as:

Find all companies that make only products with price < 200
3. Subqueries in WHERE

Find all companies s.t. all their products have price < 200

same as:

Find all companies that make only products with price < 200
3. Subqueries in WHERE

Find all companies s.t. all their products have price < 200

same as:

Find all companies that make only products with price < 200
Product (pname, price, cid)
Company(cid, cname, city)

3. Subqueries in WHERE

Find all companies s.t. all their products have price < 200

1. Find the other companies: i.e. s.t. some product ≥ 200

```
SELECT DISTINCT  C.cname
FROM    Company C
WHERE   C.cid IN (SELECT P.cid
                   FROM    Product P
                   WHERE  P.price >= 200)
```
3. Subqueries in WHERE

Find all companies s.t. all their products have price < 200

1. Find the other companies: i.e. s.t. some product ≥ 200

```
SELECT DISTINCT C.cname
FROM Company C
WHERE C.cid IN (SELECT P.cid
    FROM Product P
    WHERE P.price >= 200)
```

2. Find all companies s.t. all their products have price < 200

```
SELECT DISTINCT C.cname
FROM Company C
WHERE C.cid NOT IN (SELECT P.cid
    FROM Product P
    WHERE P.price >= 200)
```
3. Subqueries in WHERE

Find all companies s.t. all their products have price < 200

Using EXISTS:

```
SELECT DISTINCT C.cname
FROM Company C
WHERE NOT EXISTS (SELECT *
  FROM Product P
  WHERE P.cid = C.cid AND P.price >= 200)
```
3. Subqueries in WHERE

Find all companies s.t. all their products have price < 200

Using ALL:

```
SELECT DISTINCT C.cname
FROM Company C
WHERE 200 >= ALL (SELECT price
                   FROM Product P
                   WHERE P.cid = C.cid)
```
3. Subqueries in WHERE

Find all companies s.t. all their products have price < 200

Using **ALL**:  

```
SELECT DISTINCT C.cname 
FROM Company C 
WHERE 200 >= ALL (SELECT price 
FROM Product P 
WHERE P.cid = C.cid) 
```
Question for Database Fans and their Friends

- Can we unnest the *universal quantifier* query?
Monotone Queries

• Definition A query Q is **monotone** if:
  – Whenever we add tuples to one or more input tables, the answer to the query will not lose any of the tuples.

<table>
<thead>
<tr>
<th>Product</th>
<th>Company</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>cid</td>
</tr>
<tr>
<td>Gizmo</td>
<td>19.99</td>
</tr>
<tr>
<td>Gadget</td>
<td>999.99</td>
</tr>
<tr>
<td>Camera</td>
<td>149.99</td>
</tr>
</tbody>
</table>

Q

A | B
--|--
Gizmo | Lyon
Camera | Lodtz
Monotone Queries

- Definition A query $Q$ is **monotone** if:
  - Whenever we add tuples to one or more input tables, the answer to the query will not lose any of the tuples.

<table>
<thead>
<tr>
<th>Product</th>
<th>Company</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>cid</td>
</tr>
<tr>
<td>price</td>
<td>cname</td>
</tr>
<tr>
<td>cid</td>
<td>city</td>
</tr>
<tr>
<td>Gizmo</td>
<td>c001</td>
</tr>
<tr>
<td>19.99</td>
<td>Sunworks</td>
</tr>
<tr>
<td>Gadget</td>
<td>c004</td>
</tr>
<tr>
<td>999.99</td>
<td>DB Inc.</td>
</tr>
<tr>
<td>Camera</td>
<td>c003</td>
</tr>
<tr>
<td>149.99</td>
<td>Builder</td>
</tr>
<tr>
<td>iPad</td>
<td>c001</td>
</tr>
<tr>
<td>499.99</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Product</th>
<th>Company</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>cid</td>
</tr>
<tr>
<td>price</td>
<td>cname</td>
</tr>
<tr>
<td>cid</td>
<td>city</td>
</tr>
<tr>
<td>Gizmo</td>
<td>c002</td>
</tr>
<tr>
<td>19.99</td>
<td>Sunworks</td>
</tr>
<tr>
<td>Gadget</td>
<td>c001</td>
</tr>
<tr>
<td>999.99</td>
<td>DB Inc.</td>
</tr>
<tr>
<td>Camera</td>
<td>c003</td>
</tr>
<tr>
<td>149.99</td>
<td>Builder</td>
</tr>
<tr>
<td>iPad</td>
<td>c001</td>
</tr>
<tr>
<td>499.99</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gizmo</td>
<td>Lyon</td>
</tr>
<tr>
<td>Camera</td>
<td>Lodtz</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gizmo</td>
<td>Lyon</td>
</tr>
<tr>
<td>Camera</td>
<td>Lodtz</td>
</tr>
<tr>
<td>iPad</td>
<td>Lyon</td>
</tr>
</tbody>
</table>
Monotone Queries

- **Definition** A query $Q$ is **monotone** if:
  - Whenever we add tuples to one or more input tables, the answer to the query will not lose any of the tuples

<table>
<thead>
<tr>
<th>Product</th>
<th>Company</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>pname</strong></td>
<td><strong>cname</strong></td>
</tr>
<tr>
<td>Gizmo</td>
<td>Sunworks</td>
</tr>
<tr>
<td>Gadget</td>
<td>DB Inc.</td>
</tr>
<tr>
<td>Camera</td>
<td>Builder</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Product</th>
<th>Company</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>pname</strong></td>
<td><strong>city</strong></td>
</tr>
<tr>
<td>Gizmo</td>
<td>Lyon</td>
</tr>
<tr>
<td>Camera</td>
<td>Lodtz</td>
</tr>
</tbody>
</table>

Is the mystery query monotone?

<table>
<thead>
<tr>
<th>Product</th>
<th>Company</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>pname</strong></td>
<td><strong>cname</strong></td>
</tr>
<tr>
<td>Gizmo</td>
<td>Sunworks</td>
</tr>
<tr>
<td>Gadget</td>
<td>DB Inc.</td>
</tr>
<tr>
<td>iPad</td>
<td>Builder</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Product</th>
<th>Company</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>pname</strong></td>
<td><strong>city</strong></td>
</tr>
<tr>
<td>Gizmo</td>
<td>Lyon</td>
</tr>
<tr>
<td>Camera</td>
<td>Lodtz</td>
</tr>
</tbody>
</table>

iPad Lyon
Monotone Queries

• **Theorem:** If Q is a SELECT-FROM-WHERE query that does not have subqueries, and no aggregates, then it is monotone.
Monotone Queries

• **Theorem**: If Q is a SELECT-FROM-WHERE query that does not have subqueries, and no aggregates, then it is monotone.

• Proof. We use the nested loop semantics: if we insert a tuple in a relation $R_i$, this will not remove any tuples from the answer.

```sql
SELECT a_1, a_2, ..., a_k
FROM  R_1 AS x_1, R_2 AS x_2, ..., R_n AS x_n
WHERE Conditions
```

```plaintext
for x_1 in R_1 do
  for x_2 in R_2 do
    .....  
  for x_n in R_n do
    if Conditions
      output (a_1,...,a_k)
```

CSE 344 - Winter 2015
