

Introduction to Data Management

CSE 344

Lectures 18: Design Theory

Announcements

- HW6 and WQ6 are out
 - Due on Monday, 11/21
- Back to Tues/Wed cycle for HW7-8 and WQ7
- Today and next lecture:
 - Design theory (3.1-3.4)

Where are we?

- First half of 344:
 - Data models: instance, schema, languages
 - Relational and NoSQL
 - Query processing
- Second half of 344: Using DBMSs effectively
 - Conceptual design
 - Transactions
 - Parallel databases

What is this class about?

- **Focus: Using DBMSs**
- Relational Data Model
 - SQL, Relational Algebra, Relational Calculus, datalog
- Semistructured Data Model
 - JSon, CouchDB (NoSQL)
- Conceptual design
 - E/R diagrams, Views, and Database normalization
- Transactions
- Parallel databases, MapReduce, and Spark
- Data integration and data cleaning

Database Design Process

Conceptual Model:

Lec 17

Relational Model:
Tables + constraints
And also functional dep.

Sec 7 +
Lec 18

Normalization:
Eliminates anomalies

Lec 18
Lec 19

Conceptual Schema

Physical storage details

Physical Schema

Before
Midterm

What makes good schemas?

Relational Schema Design

| Name | <u>SSN</u> | <u>PhoneNumber</u> | City |
|------|-------------|--------------------|-----------|
| Fred | 123-45-6789 | 206-555-1234 | Seattle |
| Fred | 123-45-6789 | 206-555-6543 | Seattle |
| Joe | 987-65-4321 | 908-555-2121 | Westfield |

One person may have multiple phones, but lives in only one city

Primary key is thus (SSN, PhoneNumber)

What is the problem with this schema?

Relational Schema Design

| <u>Name</u> | <u>SSN</u> | <u>PhoneNumber</u> | City |
|-------------|-------------|--------------------|-----------|
| Fred | 123-45-6789 | 206-555-1234 | Seattle |
| Fred | 123-45-6789 | 206-555-6543 | Seattle |
| Joe | 987-65-4321 | 908-555-2121 | Westfield |

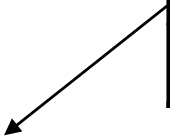

Anomalies:

- **Redundancy** = repeat data
- **Update anomalies** = what if Fred moves to “Bellevue”?
- **Deletion anomalies** = what if Joe deletes his phone number?

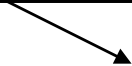

Relation Decomposition

Break the relation into two:

| Name | SSN | PhoneNumber | City |
|------|-------------|--------------|-----------|
| Fred | 123-45-6789 | 206-555-1234 | Seattle |
| Fred | 123-45-6789 | 206-555-6543 | Seattle |
| Joe | 987-65-4321 | 908-555-2121 | Westfield |

| Name | <u>SSN</u> | City |
|------|-------------|-----------|
| Fred | 123-45-6789 | Seattle |
| Joe | 987-65-4321 | Westfield |

| <u>SSN</u> | <u>PhoneNumber</u> |
|-------------|--------------------|
| 123-45-6789 | 206-555-1234 |
| 123-45-6789 | 206-555-6543 |
| 987-65-4321 | 908-555-2121 |

Anomalies have gone:

- No more repeated data
- Easy to move Fred to “Bellevue” (how ?)
- Easy to delete all Joe’s phone numbers (how ?)

Relational Schema Design (or Logical Design)

How do we do this systematically?

- Start with some relational schema
- Find out its *functional dependencies* (FDs)
- Use FDs to *normalize* the relational schema

Functional Dependencies (FDs)

Definition

If two tuples agree on the attributes

A_1, A_2, \dots, A_n

then they must also agree on the attributes

B_1, B_2, \dots, B_m

Formally:

$A_1 \dots A_n$ determines $B_1 \dots B_m$

$A_1, A_2, \dots, A_n \rightarrow B_1, B_2, \dots, B_m$

Functional Dependencies (FDs)

Definition $A_1, \dots, A_m \rightarrow B_1, \dots, B_n$ holds in R if:

$\forall t, t' \in R,$

$(t.A_1 = t'.A_1 \wedge \dots \wedge t.A_m = t'.A_m \rightarrow t.B_1 = t'.B_1 \wedge \dots \wedge t.B_n = t'.B_n)$

| R | A_1 | ... | A_m | | B_1 | ... | B_n | | |
|----|-------|-----|-------|--|-------|-----|-------|--|--|
| t | | | | | | | | | |
| t' | | | | | | | | | |

if t, t' agree here then t, t' agree here

Example

An FD holds, or does not hold on an instance:

| EmpID | Name | Phone | Position |
|--------------|-------------|--------------|-----------------|
| E0045 | Smith | 1234 | Clerk |
| E3542 | Mike | 9876 | Salesrep |
| E1111 | Smith | 9876 | Salesrep |
| E9999 | Mary | 1234 | Lawyer |

EmpID → Name, Phone, Position

Position → Phone

but not Phone → Position

Example

| EmpID | Name | Phone | Position |
|--------------|-------------|--------------|-----------------|
| E0045 | Smith | 1234 | Clerk |
| E3542 | Mike | 9876 ← | Salesrep |
| E1111 | Smith | 9876 ← | Salesrep |
| E9999 | Mary | 1234 | Lawyer |

Position → Phone

Example

| EmpID | Name | Phone | Position |
|--------------|-------------|--------------|-----------------|
| E0045 | Smith | 1234 → | Clerk |
| E3542 | Mike | 9876 | Salesrep |
| E1111 | Smith | 9876 | Salesrep |
| E9999 | Mary | 1234 → | Lawyer |

But not Phone → Position

Example

name \rightarrow color
category \rightarrow department
color, category \rightarrow price

| name | category | color | department | price |
|---------|----------|-------|------------|-------|
| Gizmo | Gadget | Green | Toys | 49 |
| Tweaker | Gadget | Green | Toys | 99 |

Do all the FDs hold on this instance?

Example

name → color
category → department
color, category → price

| name | category | color | department | price |
|---------|------------|-------|--------------|-------|
| Gizmo | Gadget | Green | Toys | 49 |
| Tweaker | Gadget | Green | Toys | 49 |
| Gizmo | Stationary | Green | Office-supp. | 59 |

What about this one ?

Terminology

- FD **holds** or **does not hold** on an instance
- If we can be sure that *every instance of R* will be one in which a given FD is true, then we say that **R satisfies the FD**
- If we say that R satisfies an FD F, we are **stating a constraint on R**
 - Recall constraints from lec 17 and sec 7

Why bother with FDs?

| Name | <u>SSN</u> | <u>PhoneNumber</u> | City |
|------|-------------|--------------------|-----------|
| Fred | 123-45-6789 | 206-555-1234 | Seattle |
| Fred | 123-45-6789 | 206-555-6543 | Seattle |
| Joe | 987-65-4321 | 908-555-2121 | Westfield |

Anomalies:

- **Redundancy** = repeat data
- **Update anomalies** = what if Fred moves to “Bellevue”?
- **Deletion anomalies** = what if Joe deletes his phone number?

An Interesting Observation

If all these FDs are true:

$\text{name} \rightarrow \text{color}$
 $\text{category} \rightarrow \text{department}$
 $\text{color, category} \rightarrow \text{price}$

Then this FD also holds:

$\text{name, category} \rightarrow \text{price}$

If we find out from application domain that a relation satisfies some FDs, it doesn't mean that we found all the FDs that it satisfies! There could be more FDs implied by the ones we have.

Closure of a set of Attributes

Given a set of attributes A_1, \dots, A_n

The **closure** is the set of attributes B , notated $\{A_1, \dots, A_n\}^+$,
s.t. $A_1, \dots, A_n \rightarrow B$

Example:

1. name \rightarrow color
2. category \rightarrow department
3. color, category \rightarrow price

Closures:

$$\text{name}^+ = \{\text{name}, \text{color}\}$$

$$\{\text{name}, \text{category}\}^+ = \{\text{name}, \text{category}, \text{color}, \text{department}, \text{price}\}$$

$$\text{color}^+ = \{\text{color}\}$$

Closure Algorithm

$X = \{A_1, \dots, A_n\}$.

Repeat until X doesn't change **do:**
if $B_1, \dots, B_n \rightarrow C$ is a FD **and**
 B_1, \dots, B_n are all in X
then add C to X .

Example:

1. name \rightarrow color
2. category \rightarrow department
3. color, category \rightarrow price

$\{\text{name, category}\}^+ =$
 $\{\text{name, category, color, department, price}\}$

Hence: $\text{name, category} \rightarrow \text{color, department, price}$

Example

In class:

$R(A, B, C, D, E, F)$

| | | |
|------|---|---|
| A, B | → | C |
| A, D | → | E |
| B | → | D |
| A, F | → | B |

Compute $\{A, B\}^+$ $X = \{A, B, \}$

Compute $\{A, F\}^+$ $X = \{A, F, \}$

Example

In class:

$R(A, B, C, D, E, F)$

| | | |
|------|---|---|
| A, B | → | C |
| A, D | → | E |
| B | → | D |
| A, F | → | B |

Compute $\{A, B\}^+$ $X = \{A, B, C, D, E\}$

Compute $\{A, F\}^+$ $X = \{A, F, \quad \}$

Example

In class:

$R(A, B, C, D, E, F)$

| | | |
|------|---|---|
| A, B | → | C |
| A, D | → | E |
| B | → | D |
| A, F | → | B |

Compute $\{A, B\}^+$ $X = \{A, B, C, D, E\}$

Compute $\{A, F\}^+$ $X = \{A, F, B, C, D, E\}$

Example

In class:

$R(A, B, C, D, E, F)$

| | | |
|------|---|---|
| A, B | → | C |
| A, D | → | E |
| B | → | D |
| A, F | → | B |

Compute $\{A, B\}^+$ $X = \{A, B, C, D, E\}$

Compute $\{A, F\}^+$ $X = \{A, F, B, C, D, E\}$

Practice at Home

Find all FD's implied by:

| | | |
|------|---|---|
| A, B | → | C |
| A, D | → | B |
| B | → | D |

Practice at Home

Find all FD's implied by:

$$\begin{array}{l} A, B \rightarrow C \\ A, D \rightarrow B \\ B \rightarrow D \end{array}$$

Step 1: Compute X^+ , for every X :

$$A^+ = A, \quad B^+ = BD, \quad C^+ = C, \quad D^+ = D$$

$$AB^+ = ABCD, \quad AC^+ = AC, \quad AD^+ = ABCD,$$

$$BC^+ = BCD, \quad BD^+ = BD, \quad CD^+ = CD$$

$$ABC^+ = ABD^+ = ACD^+ = ABCD \text{ (no need to compute— why ?)}$$

$$BCD^+ = BCD, \quad ABCD^+ = ABCD$$

Step 2: Enumerate all FD's $X \rightarrow Y$, s.t. $Y \subseteq X^+$ and $X \cap Y = \emptyset$:

$$AB \rightarrow CD, \quad AD \rightarrow BC, \quad ABC \rightarrow D, \quad ABD \rightarrow C, \quad ACD \rightarrow B$$

Keys

- A **superkey** is a set of attributes A_1, \dots, A_n s.t. for any other attribute B , we have $A_1, \dots, A_n \rightarrow B$
- A **key** is a minimal superkey
 - A superkey and for which no subset is a superkey

Computing (Super)Keys

- For all sets X , compute X^+
- If $X^+ = [\text{all attributes}]$, then X is a superkey
- Try reducing to the minimal X 's to get the key

Example

Product(name, price, category, color)

name, category → price
category → color

What is the key ?

Example

Product(name, price, category, color)

name, category \rightarrow price
category \rightarrow color

What is the key ?

$(\text{name, category})^+ = \{ \text{name, category, price, color} \}$

Hence (name, category) is a key

Key or Keys ?

Can we have more than one key ?

Given $R(A,B,C)$ define FD's s.t. there are two or more distinct keys

Key or Keys ?

Can we have more than one key ?

Given $R(A,B,C)$ define FD's s.t. there are two or more distinct keys

| |
|-------------------|
| $A \rightarrow B$ |
| $B \rightarrow C$ |
| $C \rightarrow A$ |

or

| |
|--------------------|
| $AB \rightarrow C$ |
| $BC \rightarrow A$ |

or

| |
|--------------------|
| $A \rightarrow BC$ |
| $B \rightarrow AC$ |

what are the keys here ?

Eliminating Anomalies

Main idea:

- $X \rightarrow A$ is OK if X is a (super)key
- $X \rightarrow A$ is not OK otherwise
 - Need to decompose the table, but how?

Boyce-Codd Normal Form
