

# **CSE 344**

**JANUARY 26<sup>TH</sup> – DATALOG**

# **ADMINISTRATIVE MINUTIAE**

- **HW3 and OQ3 out**
- **HW3 due next Friday**
- **OQ3 due next Wednesday**
- **HW4 out next week: on Datalog**
- **Midterm reminder: Feb 9<sup>th</sup>**

# RELATIONAL ALGEBRA

Set-at-a-time algebra, which manipulates relations

In SQL we say what we want

In RA we can express how to get it

Every DBMS implementations converts a SQL query to RA in order to execute it

An RA expression is called a query plan

# BASICS

- Relations and attributes
- Functions that are applied to relations
  - Return relations
  - Can be composed together
  - Often displayed using a tree rather than linearly
  - Use Greek symbols:  $\sigma$ ,  $\pi$ ,  $\delta$ , etc

# JOIN SUMMARY

**Theta-join:**  $R \bowtie_{\theta} S = \sigma_{\theta} (R \times S)$

- Join of R and S with a join condition  $\theta$
- Cross-product followed by selection  $\theta$
- No projection

**Equijoin:**  $R \bowtie_{\theta} S = \sigma_{\theta} (R \times S)$

- Join condition  $\theta$  consists only of equalities
- No projection

**Natural join:**  $R \bowtie S = \pi_A (\sigma_{\theta} (R \times S))$

- Equality on **all** fields with same name in R and in S
- Projection  $\pi_A$  drops all redundant attributes

# MORE JOINS

## Outer join

- Include tuples with no matches in the output
- Use NULL values for missing attributes
- Does not eliminate duplicate columns

## Variants

- Left outer join
- Right outer join
- Full outer join

# SOME EXAMPLES

Supplier(sno, sname, scity, sstate)

Part(pno, pname, psize, pcolor)

Supply(sno, pno, qty, price)

**Name of supplier of parts with size greater than 10**

$\pi_{\text{sname}}(\text{Supplier} \bowtie \text{Supply} \bowtie (\sigma_{\text{psize} > 10}(\text{Part})))$

**Name of supplier of red parts or parts with size greater than 10**

$\pi_{\text{sname}}(\text{Supplier} \bowtie \text{Supply} \bowtie (\sigma_{\text{psize} > 10}(\text{Part}) \cup \sigma_{\text{pcolor} = \text{'red'}}(\text{Part})))$

$\pi_{\text{sname}}(\text{Supplier} \bowtie \text{Supply} \bowtie (\sigma_{\text{psize} > 10 \vee \text{pcolor} = \text{'red'}}(\text{Part})))$

**Can be represented as trees as well**

# REPRESENTING RA QUERIES AS TREES

Supplier(sno, sname, scity, sstate)

Part(pno, pname, psize, pcolor)

Supply(sno, pno, qty, price)

# RELATIONAL ALGEBRA OPERATORS

Union  $\cup$ , ~~intersection  $\cap$~~ , difference  $-$

Selection  $\sigma$

Projection  $\pi$

Cartesian product  $\times$ , join  $\bowtie$

(Rename  $\rho$ )

Duplicate elimination  $\delta$

Grouping and aggregation  $\gamma$

Sorting  $\tau$

All operators take in 1 or more relations as inputs and return another relation

# EXTENDED RA: OPERATORS ON BAGS

**Duplicate elimination  $\delta$**

**Grouping  $\gamma$**

- Takes in relation and a list of grouping operations (e.g., aggregates). Returns a new relation.

**Sorting  $\tau$**

- Takes in a relation, a list of attributes to sort on, and an order. Returns a new relation.

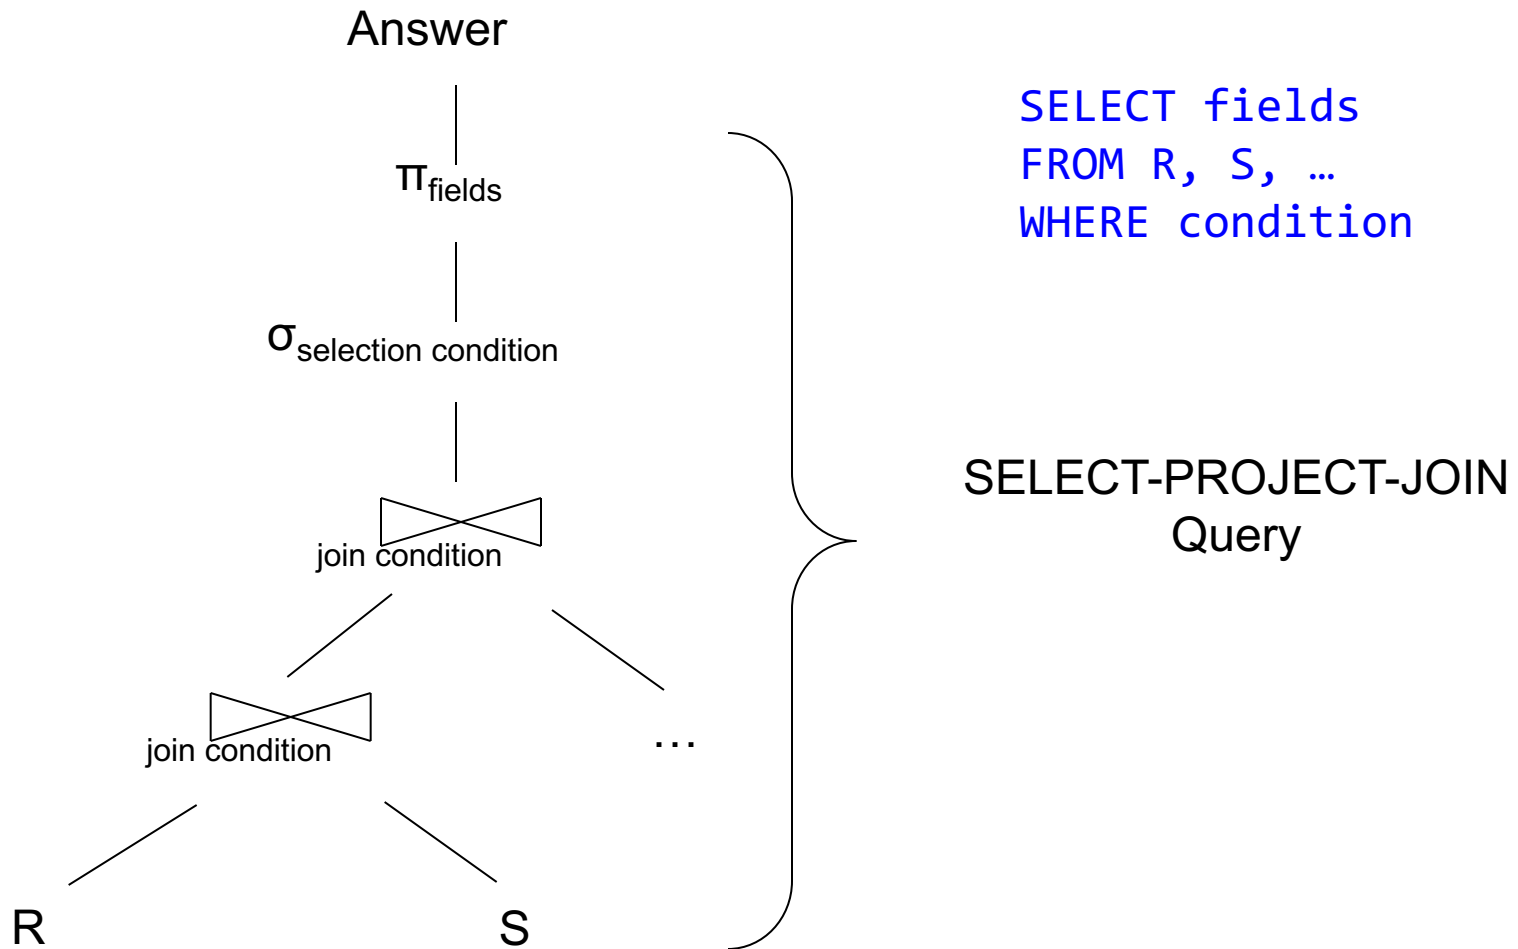

# USING EXTENDED RA OPERATORS

```
SELECT city, sum(quantity)
FROM sales
GROUP BY city
HAVING count(*) > 100
```

T1, T2 = temporary tables

# TYPICAL PLAN FOR A QUERY (1/2)

# TYPICAL PLAN FOR A QUERY (1/2)

SELECT fields  
FROM R, S, ...  
WHERE condition  
GROUP BY fields  
HAVING condition

# HOW ABOUT SUBQUERIES?

Supplier(sno, sname, scity, sstate)  
Part(pno, pname, psize, pcolor)  
Supply(sno, pno, price)

```
SELECT Q.sno
FROM Supplier Q
WHERE Q.sstate = 'WA'
and not exists
(SELECT *
FROM Supply P
WHERE P.sno = Q.sno
and P.price > 100)
```

# HOW ABOUT SUBQUERIES?

Supplier(sno, sname, scity, sstate)  
Part(pno, pname, psize, pcolor)  
Supply(sno, pno, price)

```
SELECT Q.sno
FROM Supplier Q
WHERE Q.sstate = 'WA'
and not exists
(SELECT *
FROM Supply P
WHERE P.sno = Q.sno
and P.price > 100)
```

Correlation !

# HOW ABOUT SUBQUERIES?

Supplier(sno, sname, scity, sstate)  
Part(pno, pname, psize, pcolor)  
Supply(sno, pno, price)

```
SELECT Q.sno
FROM Supplier Q
WHERE Q.sstate = 'WA'
and not exists
(SELECT *
FROM Supply P
WHERE P.sno = Q.sno
and P.price > 100)
```

De-Correlation

```
SELECT Q.sno
FROM Supplier Q
WHERE Q.sstate = 'WA'
and Q.sno not in
(SELECT P.sno
FROM Supply P
WHERE P.price > 100)
```

# HOW ABOUT SUBQUERIES?

Supplier(sno, sname, scity, sstate)  
Part(pno, pname, psize, pcolor)  
Supply(sno, pno, price)

Un-nesting

```
(SELECT Q.sno
FROM Supplier Q
WHERE Q.sstate = 'WA')
EXCEPT
(SELECT P.sno
FROM Supply P
WHERE P.price > 100)
```

```
SELECT Q.sno
FROM Supplier Q
WHERE Q.sstate = 'WA'
and Q.sno not in
(SELECT P.sno
FROM Supply P
WHERE P.price > 100)
```

EXCEPT = set difference

# HOW ABOUT SUBQUERIES?

Supplier(sno, sname, scity, sstate)  
Part(pno, pname, psize, pcolor)  
Supply(sno, pno, price)

```
(SELECT Q.sno
FROM Supplier Q
WHERE Q.sstate = 'WA')
EXCEPT
(SELECT P.sno
FROM Supply P
WHERE P.price > 100)
```

Finally...

# SUMMARY OF RA AND SQL

SQL = a declarative language where we say what data we want to retrieve

RA = an algebra where we say how we want to retrieve the data

Theorem: SQL and RA can express exactly the same class of queries

RDBMS translate SQL  $\rightarrow$  RA, then optimize RA

# **RELATIONAL ALGEBRA TAKEAWAYS**

- **Be able to get a query write the relational algebra expression equivalent to it**
- **Given a relational algebra expression, write the equivalent query**
- **Understand what each are trying to get semantically**

# SUMMARY OF RA AND SQL

**SQL (and RA) cannot express ALL queries that we could write in, say, Java**

**Example:**

- Parent(p,c): find all descendants of 'Alice'
- No RA query can compute this!
- This is called a *recursive query*

***Datalog* is an extension that can compute recursive queries**

# WHAT IS DATALOG?

## Another query language for relational model

- Designed in the 80's
- Simple, concise, elegant
- Extends relational queries with recursion

**Relies on a logical framework for "record" selection**

# DATALOG: FACTS AND RULES

Facts = tuples in the database

Rules = queries

```
Actor(id, fname, lname)
Casts(pid, mid)
Movie(id, name, year)
```

Schema

# DATALOG: FACTS AND RULES

Facts = tuples in the database

Rules = queries

Actor(344759, 'Douglas', 'Fowley').  
Casts(344759, 29851).  
Casts(355713, 29000).  
Movie(7909, 'A Night in Armour', 1910).

Casts(z,x2), Movie(x2,y2,1940)

Extensional Database Predicates = EDB = Actor, Casts, Movie

Intensional Database Predicates = IDB = Q1, Q2, Q3

# DATALOG: TERMINOLOGY

f, l = head variables

x, y, z = existential variables

# MORE DATALOG TERMINOLOGY

$Q(\text{args}) :- R1(\text{args}), R2(\text{args}), \dots$

$R_i(\text{args}_i)$  called an atom, or a relational predicate

$R_i(\text{args}_i)$  evaluates to true when relation  $R_i$  contains the tuple described by  $\text{args}_i$ .

- Example: Actor(344759, 'Douglas', 'Fowley') is true

**In addition we can also have arithmetic predicates**

- Example:  $z > '1940'$ .

**Book uses AND instead of ,**

$Q(\text{args}) :- R1(\text{args}) \text{ AND } R2(\text{args}) \dots$

# SEMANTICS OF A SINGLE RULE

Meaning of a datalog rule = a logical statement !

$$Q1(y) \text{ :- Movie}(x,y,z), z='1940'.$$

- For all  $x, y, z$ : if  $(x,y,z) \in \text{Movies}$  and  $z = '1940'$  then  $y$  is in  $Q1$  (i.e. is part of the answer)
- $\forall x \forall y \forall z [( \text{Movie}(x,y,z) \text{ and } z='1940' ) \Rightarrow Q1(y)]$
- Logically equivalent:  
 $\forall y [( \exists x \exists z \text{ Movie}(x,y,z) \text{ and } z='1940' ) \Rightarrow Q1(y)]$
- Thus, non-head variables are called "existential variables"
- We want the smallest set  $Q1$  with this property (why?)

# **DATALOG PROGRAM**

**A datalog program consists of several rules**

**Importantly, rules may be recursive!**

**Usually there is one distinguished predicate that's the output**

**We will show an example first, then give the general semantics.**

# EXAMPLE

R encodes a graph

R=

1	2
2	1
2	3
1	4
3	4
4	5

# EXAMPLE

R encodes a graph

R=

1	2
2	1
2	3
1	4
3	4
4	5

$T(x,y) :- R(x,y)$   
 $T(x,y) :- R(x,z), T(z,y)$

What does it compute?

# EXAMPLE

R encodes a graph

R=

1	2
2	1
2	3
1	4
3	4
4	5

Initially:  
T is empty.

$T(x,y) :- R(x,y)$   
 $T(x,y) :- R(x,z), T(z,y)$

What does  
it compute?

# EXAMPLE

R encodes a graph

R =

1	2
2	1
2	3
1	4
3	4
4	5

Initially:  
T is empty.

First iteration:  
T =

1	2
2	1
2	3
1	4
3	4
4	5

First rule generates this

Second rule  
generates nothing  
(because T is empty)

$T(x,y) \text{ :- } R(x,y)$   
 $T(x,y) \text{ :- } R(x,z), T(z,y)$

What does  
it compute?

# EXAMPLE

R encodes a graph

R =

1	2
2	1
2	3
1	4
3	4
4	5

Initially:  
T is empty.

First iteration:
