WHERE WE ARE

So far we have studied the *relational data model*

- Data is stored in tables(=relations)
- Queries are expressions in SQL, relational algebra, or Datalog

This week: Semistructured data model

- Popular formats today: XML, JSon, protobuf

DATA MODELS

Taxonomy based on data models:

Key-value stores

- e.g., Project Voldemort, Memcached

Document stores

- e.g., SimpleDB, CouchDB, MongoDB

Extensible Record Stores

- e.g., HBase, Cassandra, PNUTS

MOTIVATION

In Key, Value stores, the Value is often a very complex object

- Key = '2010/7/1', Value = [all flights that date]

Better: allow DBMS to understand the *value*

- Represent *value* as a JSON (or XML...) document
- [all flights on that date] = a JSON file
- May search for all flights on a given date

ASTERIXDB AND SQL++

AsterixDB

- No-SQL database system
- Developed at UC Irvine
- Now an Apache project
- Own query language: AsterixQL or AQL, based on XQuery

SQL++

- SQL-like syntax for AsterixQL

EXAMPLES

Try these queries:

```
SELECT x.age FROM [{'name': 'Alice', 'age': ['30', '50']}] x;
```

```
SELECT x.age FROM {{ {'name': 'Alice', 'age': ['30', '50']} }} x;
```

Can only select from multi-set or array

```
-- error
SELECT x.age FROM {'name': 'Alice', 'age': ['30', '50']} x;
```

DATATYPES

Boolean, integer, float (various precisions), geometry (point, line, …), date, time, etc

UUID = universally unique identifier
Use it as a system-generated unique key

SQL++ OVERVIEW

Data Definition Language (DDL): create a

- Dataverse
- Type
- Dataset
- Index

Data Manipulation Language (DML): select-from-where

DATAVERSE

A Dataverse is a Database

```
CREATE DATAVERSE lec344
CREATE DATAVERSE lec344 IF NOT EXISTS

DROP DATAVERSE lec344
DROP DATAVERSE lec344 IF EXISTS

USE lec344
```

TYPE

Defines the schema of a collection

It lists all ***required*** fields

Fields followed by ? are ***optional***

`CLOSED` type = no other fields allowed

`OPEN` type = other fields allowed

CLOSED TYPES

```
USE lec344;
DROP TYPE PersonType IF EXISTS;
CREATE TYPE PersonType AS CLOSED {
   Name : string,
   age: int,
   email: string?
}
```

{"Name": "Alice", "age": 30, "email": "a@alice.com"}

{"Name": "Bob", "age": 40}

-- not OK:
{"Name": "Carol", ~~"phone": "123456789"~~}

OPEN TYPES

```
USE lec344;
DROP TYPE PersonType IF EXISTS;
CREATE TYPE PersonType AS OPEN {
   Name : string,
   age: int,
   email: string?
}
```

{"Name": "Alice", "age": 30, "email": "a@alice.com"}

{"Name": "Bob", "age": 40}

-- Now it’s OK:
{"Name": "Carol", “age”: 50, "phone": "123456789"}

TYPES WITH NESTED COLLECTIONS

```
USE lec344;
DROP TYPE PersonType IF EXISTS;
CREATE TYPE PersonType AS CLOSED {
   Name : string,
   phone: [string]
}
```

{"Name": "Carol", "phone": ["1234”]}
{"Name": ”David", "phone": [“2345”, “6789”]}
{"Name": ”Eric", "phone": []}

DATASETS

Dataset = relation

Must have a type

- Can be a trivial `OPEN` type

Must have a key

- Can also be a trivial one

DATASET WITH AUTO GENERATED KEY

```
USE lec344;
DROP TYPE PersonType IF EXISTS;
CREATE TYPE PersonType AS CLOSED {
   myKey: uuid,
   Name : string,
   email: string?
}
```

{“Name”: “Alice”}
{“Name”: “Bob”}
…

Note: no myKey since it will be autogenerated

```
USE lec344;
DROP DATASET Person IF EXISTS;
CREATE DATASET Person(PersonType)
    PRIMARY KEY myKey AUTOGENERATED;
```

INDEXES

Can declare an index on an attribute of a top-most collection

Available:

- BTREE: good for equality and range queries
  E.g. name="Greece"; 20 < age and age < 40
- RTREE: good for 2-dimensional range queries
  E.g. 20 < x and x < 40 and 10 < y and y < 50
- KEYWORD: good for substring search

NESTED COLLECTIONS

If the value of attribute B is a collection, then we simply iterate over it

```
SELECT x.A, y.C, y.D
FROM mydata as x, x.B as y;
```

x.B is a collection

```
{"A": "a1", "B": [{"C": "c1", "D": "d1"}, {"C": "c2", "D": "d2"}]}
{"A": "a2", "B": [{"C": "c3", "D": "d3"}]}

MULTI-VALUE JOIN

Recall: a many-to-one relation should have one foreign key, from “many” to “one”

Sometimes people represent it in the opposite direction, from “one” to “many”:

- The reference is a string of keys separated by space
- Need to use split(string, separator) to split it into a collection of foreign keys

MULTI-VALUE JOIN

```
 river =
[{"name": "Donau”, "-country": "SRB A D H HR SK BG RO MD UA”},
 {"name": "Colorado”, "-country": "MEX USA”},
  ... ]
```

MULTI-VALUE JOIN

```
river =
[{"name": "Donau", "-country": "SRB A D H HR SK BG RO MD UA"},
 {"name": "Colorado", "-country": "MEX USA"},

BEHIND THE SCENES

Query Processing on NFNF data:

Option 1: give up on query plans, use standard java/python-like execution

Option 2: represent the data as a collection of flat tables, convert SQL++ to a standard relational query plan

FLATTENING SQL++ QUERIES

A nested collection

```
coll =

SEMISTRUCTURED DATA MODEL

Several file formats: Json, protobuf, XML

The data model is a tree

They differ in how they handle structure:

- Open or closed
- Ordered or unordered

CONCLUSION

Semistructured data best suited for *data exchange*

For quick, ad-hoc data analysis, use a native query language: SQL++, or AQL, or XQuery

- Modern, advanced query processors like AsterixDB / SQL++ can process semistructured data as efficiently as RDBMS

For long term data analysis: spend the time and effort to normalize it, then store in a RDBMS
