# Introduction to Data Management CSE 344 

Unit 4: RDBMS Internals<br>Logical and Physical Plans<br>Query Execution<br>Query Optimization

(3 lectures)

# Introduction to Data Management CSE 344 

## Lecture 15: Introduction to Query <br> Evaluation

## Announcements

Makeup lecture tomorrow, 4:30pm, BAG 131

HW6: we will use AWS. Do the setup early:

- If no account yet, sign up aws.amazon.com
- Request credits aws.amazon.com/awscredits

## Class Overview

- Unit 1: Intro
- Unit 2: Relational Data Models and Query Languages
- Unit 3: Non-relational data
- Unit 4: RDMBS internals and query optimization
- Unit 5: Parallel query processing
- Unit 6: DBMS usability, conceptual design
- Unit 7: Transactions
- Unit 8: Advanced topics (time permitting)

## From Logical RA Plans to Physical Plans

## Query Evaluation Steps Review

## SQL query

Parse \& Rewrite Query

Query optimization

Physical plan

Disk

## Relational Algebra Operators

- Union $\cup$, intersection $\cap$, difference -
- Selection $\sigma$
- Projection $\pi$
- Cartesian product $\times$, join $\bowtie$
- (Rename $\rho$ )
- Duplicate elimination $\delta$
- Grouping and aggregation $\gamma$

Extended RA

- Sorting $\tau$

## Physical Operators

- For each operators above, several possible algorithms
- Main memory or external memory algorithms
- Examples:
- Main memory hash join
- External memory merge join
- External memory partitioned hash join
- Sort-based group by
- Etc, etc

Supplier(sid, sname, scity, sstate)
Supply(sid, pno, quantity)

## Main Memory Algorithms

Logical operator:
Supplier $\bowtie_{\text {sid=sid }}$ Supply
Propose three physical operators for the join, assuming the tables are in main memory:
1.
2.
3.

Supplier(sid, sname, scity, sstate)
Supply(sid, pno, quantity)

## Main Memory Algorithms

Logical operator:
Supplier $\bowtie_{\text {sid=sid }}$ Supply
Propose three physical operators for the join, assuming the tables are in main memory:

1. Nested Loop Join
2. Merge join
3. Hash join

O(??)
O(??)
O(??)

Supplier(sid, sname, scity, sstate)
Supply(sid, pno, quantity)

## Main Memory Algorithms

Logical operator:
Supplier $\bowtie_{\text {sid=sid }}$ Supply
Propose three physical operators for the join, assuming the tables are in main memory:

1. Nested Loop Join
2. Merge join
3. Hash join
$O\left(n^{2}\right)$
$O(n \log n)$
$O(n) \ldots O\left(n^{2}\right)$

## BRIEF Review of Hash Tables

 Separate chaining:A (naïve) hash function:
$h(x)=x \bmod 10$

Operations:
find $(103)=$ ?? insert(488) = ??

## BRIEF Review of Hash Tables

- insert( $k, v$ ) $=$ inserts a key $k$ with value $v$
- Many values for one key
- Hence, duplicate k's are OK
- find(k) $=$ returns the list of all values $v$ associated to the key k

## Recap of Main Memory Algorithms

- Join $\bowtie$ :
- Nested loop join
- Hash join
- Merge join
- Selection $\sigma$
- "on-the-fly"
- Index-based selection (next lecture)
- Group by $\gamma$
- Hash-based
- Merge-based

## How Do We Combine Them?

## How Do We Combine Them?

The Iterator Interface

- open()
- next()
- close()

# Implementing Query Operators with the Iterator Interface 

Example "on the fly" selection operator

# Implementing Query Operators with the Iterator Interface 

Example "on the fly" selection operator

```
interface Operator {
    // initializes operator state
    // and sets parameters
    void open (...);
```

# Implementing Query Operators with the Iterator Interface 

Example "on the fly" selection operator

```
interface Operator {
    // initializes operator state
    // and sets parameters
    void open (...);
    // calls next() on its inputs
    // processes an input tuple
    // produces output tuple(s)
    // returns null when done
    Tuple next ();
```

# Implementing Query Operators with the Iterator Interface 

Example "on the fly" selection operator

```
interface Operator {
    // initializes operator state
    // and sets parameters
    void open (...);
    // calls next() on its inputs
    // processes an input tuple
    // produces output tuple(s)
    // returns null when done
    Tuple next ();
    // cleans up (if any)
    void close ();
}
```

# Implementing Query Operators with the Iterator Interface 

Example "on the fly" selection operator

```
interface Operator {
    // initializes operator state
    // and sets parameters
    void open (...);
    // calls next() on its inputs
    // processes an input tuple
    // produces output tuple(s)
    // returns null when done
Tuple next ();
// cleans up (if any)

Implementing Query Operators with the Iterator Interface
}

Example "on the fly" selection operator
```

interface Operator {
// initializes operator state
// and sets parameters
void open (...);
// calls next() on its inputs
// processes an input tuple
// produces output tuple(s)
// returns null when done
Tuple next ();
// cleans up (if any)
}
void close ();
class Select implements Operator \{...
void open (Predicate p,
Operator c) \{
this.p = p; this.c = c; c.open();
\}
Tuple next () \{

# Implementing Query Operators with the Iterator Interface 

Example "on the fly" selection operator

```
interface Operator {
    // initializes operator state
    // and sets parameters
    void open (...);
    // calls next() on its inputs
    // processes an input tuple
    // produces output tuple(s)
    // returns null when done
    Tuple next ();
```

    // cleans up (if any)
    void close ();
    
# Implementing Query Operators with the Iterator Interface 

Example "on the fly" selection operator

```
interface Operator {
    // initializes operator state
    // and sets parameters
    void open (...);
    // calls next() on its inputs
    // processes an input tuple
    // produces output tuple(s)
    // returns null when done
    Tuple next ();
    // cleans up (if any)
    void close ();
```

class Select implements Operator {...
void open (Predicate p,
Operator c) {
this.p = p; this.c = c; c.open();
}
Tuple next () {
boolean found = false;
Tuple r = null;
while (!found) {
r = c.next();
if (r == null) break;
found = p(r);
}
return r;
}

# Implementing Query Operators with the Iterator Interface 

Example "on the fly" selection operator

```
interface Operator {
    // initializes operator state
    // and sets parameters
    void open (...);
    // calls next() on its inputs
    // processes an input tuple
    // produces output tuple(s)
    // returns null when done
    Tuple next ();
    // cleans up (if any)
    void close ();
```

class Select implements Operator {...
void open (Predicate p,
Operator c) {
this.p = p; this.c = c; c.open();
}
Tuple next () {
boolean found = false;
Tuple r = null;
while (!found) {
r = c.next();
if (r == null) break;
found = p(r);
}
return r;
}
void close () { c.close(); }
}

```

\section*{Implementing Query Operators with the Iterator Interface}
```

interface Operator {

```
    // initializes operator state
    // and sets parameters
    void open (...);

\section*{Pipeline v.s. Blocking}
- Pipeline
- A tuple moves all the way through up the query plan
- Advantages: speed
- Disadvantage: need all hash at the same time in memory
- Blocking
- The entire result of the subplan is computed (and stored to disk) before the first tuple is sent up the plan
- Advantage: saves memory
- Disadvantage: slower

\section*{Discussion on Physical Plan}

More components of a physical plan:
- Access path selection for each relation
- Scan the relation or use an index (next lecture)
- Implementation choice for each operator
- Nested loop join, hash join, etc.
- Scheduling decisions for operators
- Pipelined execution or intermediate materialization

\title{
Introduction to Database Systems CSE 344
}

Lecture 16: Basics of Data Storage and Indexes

\section*{Query Performance}

To understand query performance, we need to understand:
- How is data organized on disk
- How to estimate query costs
- In this course we will focus on disk-based DBMSs

\section*{Hard Disk}
- Disks are mechanical devices
- A block = unit of read/write
- Once in main memory we call it a page
- Read only at the rotation speed!
- Consequence: sequential scan faster than random
- Good: read blocks \(1,2,3,4,5, \ldots\)
- Bad: read blocks 2342, 11, 321,9, ...
- Rule of thumb:
- Random read 1-2\% of file \(\approx\) sequential scan entire file;
- 1-2\% decreases over time, because of increased density

\section*{Student}

\section*{Data Storage}
- DBMSs store data in files
\begin{tabular}{|l|l|l|}
\hline ID & fName & IName \\
\hline 10 & Tom & Hanks \\
\hline 20 & Amy & Hanks \\
\hline... & & \\
\hline
\end{tabular}
- Most common organization is row-wise storage
- On disk, a file is split into blocks
- Each block contains a set of tuples
\begin{tabular}{|l|l|l|}
\hline 10 & Tom & Hanks \\
\hline 20 & Amy & Hanks \\
\hline \begin{tabular}{l|l|l|} 
& block 1 \\
\hline 50 & \(\ldots\) & \(\ldots\) \\
\hline 200 & \(\ldots\) & \\
\hline 220 & & \\
\hline 240 & & \\
\hline 420 & & \\
\hline 800 & & \\
\hline
\end{tabular}\(\quad\) block 2 \\
\hline
\end{tabular}

In the example, we have 4 blocks with 2 tuples each

\section*{Data File Types}

The data file can be one of:
- Heap file
- Unsorted
- Sequential file
- Sorted according to some attribute(s) called key

\section*{Index}
- An additional file, that allows fast access to records in the data file given a search key

\section*{Index}
- An additional file, that allows fast access to records in the data file given a search key
- The index contains (key, value) pairs:
- Key = an attribute value (e.g., student ID or name)
- Value = a pointer to the record OR the record itself

\section*{Index}
- An additional file, that allows fast access to records in the data file given a search key
- The index contains (key, value) pairs:
- Key = an attribute value (e.g., student ID or name)
- Value = a pointer to the record OR the record itself
- Could have many indexes for one table

Key = means here search key

\section*{This}

\section*{Is Not A Key}

\section*{Different keys:}
- Primary key - uniquely identifies a tuple
- Key of the sequential file - how the data file is sorted, if at all
- Index key - how the index is organized

CSE 344-2019wi

\section*{Student}

\section*{Example 1: Index on ID}

Index Student_ID on Student.ID Data File Student
\begin{tabular}{|l|l|l|}
\hline ID & fName & IName \\
\hline 10 & Tom & Hanks \\
\hline 20 & Amy & Hanks \\
\hline\(\ldots\) & & \\
\hline
\end{tabular}

\section*{Example 2: Index on fName \\ Data File Student \\ \begin{tabular}{|l|l|l|}
\hline ID & fName & IName \\
\hline 10 & Tom & Hanks \\
\hline 20 & Amy & Hanks \\
\hline\(\ldots\) & & \\
\hline
\end{tabular}}

Index Student_fName on Student.fName

\section*{Index Organization}
- Hash table
- B+ trees - most common
- They are search trees, but they are not binary instead have higher fan-out
- Will discuss them briefly next
- Specialized indexes: bit maps, R-trees, inverted index

\section*{B+ Tree Index by Example}
\[
d=2
\]

Find the key 40

\section*{Clustered vs Unclustered}

Every table can have only one clustered and many unclustered indexes Why?

\section*{Index Classification}
- Clustered/unclustered
- Clustered = records close in index are close in data
- Option 1: Data inside data file is sorted on disk
- Option 2: Store data directly inside the index (no separate files)
- Unclustered = records close in index may be far in data

\section*{Index Classification}
- Clustered/unclustered
- Clustered = records close in index are close in data
- Option 1: Data inside data file is sorted on disk
- Option 2: Store data directly inside the index (no separate files)
- Unclustered = records close in index may be far in data
- Primary/secondary
- Meaning 1:
- Primary \(=\) is over attributes that include the primary key
- Secondary = otherwise
- Meaning 2: means the same as clustered/unclustered

\section*{Index Classification}
- Clustered/unclustered
- Clustered = records close in index are close in data
- Option 1: Data inside data file is sorted on disk
- Option 2: Store data directly inside the index (no separate files)
- Unclustered = records close in index may be far in data
- Primary/secondary
- Meaning 1:
- Primary = is over attributes that include the primary key
- Secondary = otherwise
- Meaning 2: means the same as clustered/unclustered
- Organization B+ tree or Hash table

\section*{Summary So Far}
- Index = a file that enables direct access to records in another data file
- B+ tree / Hash table
- Clustered/unclustered
- Data resides on disk
- Organized in blocks
- Sequential reads are efficient
- Random access less efficient
- Random read 1-2\% of data worse than sequential

Student(ID, fname, Iname)

- Which indexes should we create?

\section*{In general this is a very hard problem}

\section*{Index Selection: Which Search Key}
- Make some attribute K a search key if the WHERE clause contains:
- An exact match on K
- A range predicate on K
- A join on \(K\)

\section*{The Index Selection Problem 1}

V(M, N, P);
Your workload is this 100000 queries:

\author{
SELECT * \\ FROM V \\ WHERE \(N=\) ?
}

100 queries:

\author{
SELECT * \\ FROM V \\ WHERE \(P=\) ?
}

\section*{The Index Selection Problem 1}

\section*{V(M, N, P);}

Your workload is this

100000 queries:
SELECT *
FROM V
WHERE N=?

100 queries:

\author{
SELECT * FROM V \\ WHERE \(P=\) ?
}

What indexes ?

\section*{The Index Selection Problem 1}

\section*{V(M, N, P);}

Your workload is this

100000 queries:
SELECT *
FROM V
WHERE N=?

100 queries:

> SELECT * FROM V WHERE P=?
\(A: V(N)\) and \(V(P)\) (hash tables or B-trees)

\section*{The Index Selection Problem 2}

\section*{V(M, N, P);}

Your workload is this

100000 queries:
SELECT *
FROM V
WHERE \(\mathrm{N}>\) ? and \(\mathrm{N}<\) ?

100 queries:

\author{
SELECT * FROM V WHERE \(\mathrm{P}=\) ?
}

100000 queries:
INSERT INTO V
VALUES (?, ?, ?)

What indexes ?

\section*{The Index Selection Problem 2}

\section*{V(M, N, P);}

Your workload is this

100000 queries:
```

SELECT *
FROM V
WHERE N>? and N<?

```

100 queries:
SELECT*
FROM V
WHERE \(P=\) ?

100000 queries:
INSERT INTO V
VALUES (?, ?, ?)

A: definitely \(V(N)\) (must B-tree); unsure about \(V(P)\)

\section*{The Index Selection Problem 3}

\section*{V(M, N, P);}

Your workload is this
100000 queries: 1000000 queries: 100000 queries:

\author{
SELECT * \\ FROM V \\ WHERE N=?
}

\author{
SELECT * FROM V \\ WHERE \(\mathrm{N}=\) ? and \(\mathrm{P}>\) ?
}

What indexes ?

\section*{The Index Selection Problem 3}

\section*{V(M, N, P);}

Your workload is this
100000 queries: 1000000 queries: 100000 queries:

\author{
SELECT * \\ FROM V \\ WHERE N=?
}

\author{
SELECT * FROM V
}

INSERT INTO V
VALUES (?, ?, ?)

A: \(V(N, P)\)
How does this index differ from:
1. Two indexes \(\mathrm{V}(\mathrm{N})\) and \(\mathrm{V}(\mathrm{P})\) ?

сse 3 2. An index \(V(P, N)\) ?

\section*{The Index Selection Problem 4}

\section*{V(M, N, P);}

Your workload is this 1000 queries:

\author{
SELECT * \\ FROM V \\ WHERE \(\mathrm{N}>\) ? and \(\mathrm{N}<\) ?
}

100000 queries:

\author{
SELECT * \\ FROM V \\ WHERE \(\mathrm{P}>\) ? and \(\mathrm{P}<\) ?
}

What indexes?

\section*{The Index Selection Problem 4}

\section*{V(M, N, P);}

Your workload is this 1000 queries:

\author{
SELECT * \\ FROM V \\ WHERE \(\mathrm{N}>\) ? and \(\mathrm{N}<\) ?
}

100000 queries:

\author{
SELECT * \\ FROM V \\ WHERE \(\mathrm{P}>\) ? and \(\mathrm{P}<\) ?
}
\(A: V(N)\) secondary, \(V(P)\) primary index

\section*{Two typical kinds of queries}
```

SELECT *
FROM Movie
WHERE year = ?

```
- Point queries
- What data structure should be used for index?

\author{
SELECT * \\ FROM Movie \\ WHERE year >= ? AND year <= ?
}
- Range queries
- What data structure should be used for index?

\section*{Basic Index Selection Guidelines}
- Consider queries in workload in order of importance
- Consider relations accessed by query
- No point indexing other relations
- Look at WHERE clause for possible search key
- Try to choose indexes that speed-up multiple queries

\section*{To Cluster or Not}

Remember:
- Rule of thumb:

Random reading 1-2\% of file \(\approx\) sequential scan entire file;

Range queries benefit mostly from clustering because they may read more than 1-2\%

Percentage tuples retrieved

\title{
Introduction to Database Systems CSE 344
}

\author{
Lecture 17: \\ Basics of Query Optimization and Query Cost Estimation
}

\section*{Cost Estimation}
- The optimizer considers several plans, estimates their costs, and chooses the cheapest
- This lecture: cost estimation for relational operators
- The cost is always dominated by the cost of reading from, or writing to disk

\title{
Cost of Reading Data From Disk
}

\section*{Cost Parameters}
- Cost \(=1 / \mathrm{O}+\mathrm{CPU}+\) Network BW
- We will focus on I/O in this class
- Parameters (a.k.a. statistics):
\(-B(R)=\#\) of blocks (i.e., pages) for relation \(R\)
\(-T(R)=\#\) of tuples in relation \(R\)
- \(V(R, a)=\) \# of distinct values of attribute a

\section*{Cost Parameters}
- Cost = I/O + CPU + Network BW
- We will focus on I/O in this class
- Parameters (a.k.a. statistics):
\(-B(R)=\#\) of blocks (i.e., pages) for relation \(R\)
\(-T(R)=\#\) of tuples in relation \(R\)
- \(V(R, a)=\) \# of distinct values of attribute a
```

When a is a key,V(R,a)=T(R)
When a is not a key, V(R,a) can be anything <= T(R)

```

\section*{Cost Parameters}
- Cost = I/O + CPU + Network BW
- We will focus on I/O in this class
- Parameters (a.k.a. statistics):
\(-B(R)=\#\) of blocks (i.e., pages) for relation \(R\)
\(-T(R)=\#\) of tuples in relation \(R\)
- \(V(R, a)=\) \# of distinct values of attribute a

When \(a\) is a key, \(V(R, a)=T(R)\)
When \(a\) is not a key, \(V(R, a)\) can be anything \(<=T(R)\)
- DBMS collects statistics about base tables must infer them for intermediate results

\section*{Size Estimation}

Main principle:
- Size of the output = some fraction of the size of the input
- The fraction is called the selectivity factor

\section*{Selectivity Factors for Conditions}
- \(A=c\)
- Selectivity \(f=1 / V(R, A)\) this...
- \(\mathrm{A}<\mathrm{C}\)
/* \(\sigma_{A<c}(R)^{*} /\)
- Selectivity \(f=(c-\min (R, A)) /(\max (R, A)-\min (R, A))\)
- \(\mathrm{c} 1<\mathrm{A}<\mathrm{c} 2\) /* \(\sigma_{c 1<A<c 2}(R)^{*} /\)
- Selectivity \(f=(c 2-c 1) /(\max (R, A)-\min (R, A))\)
- Cond1 ^Cond2 \(\wedge\) Cond3 ^...

- Selectivity \(=\mathrm{f} 1 * \mathrm{f} 2 * \mathrm{f} 3 *\)...(assumes independence)

\section*{Cost of Reading Data From Disk}
- Sequential scan for relation \(R\) costs \(B(R)\)
- Index-based selection
- Estimate selectivity factor f(see previous slide)
- Clustered index: \(f^{*} B(R)\)
- Unclustered index f*T(R)

Note: we ignore I/O cost for index pages

\section*{Index Based Selection}
- Example: \(\begin{aligned} & B(R)=2000 \\ & T(R)=100,000 \\ & V(R, a)=20\end{aligned}\)
\[
\text { cost of } \sigma_{a=v}(R)=\text { ? }
\]
- Table scan:
- Index based selection:

\section*{Index Based Selection}
- Example: \(\begin{aligned} & B(R)=2000 \\ & T(R)=100,000 \\ & V(R, a)=20\end{aligned}\)
\[
\text { cost of } \sigma_{a=v}(\mathrm{R})=\text { ? }
\]
- Table scan: \(B(R)=2,000\) I/Os
- Index based selection:

\section*{Index Based Selection}
- Example: \begin{tabular}{l}
\(\begin{array}{l}B(R)=2000 \\
T(R)=100,000 \\
V(R, a)=20\end{array}\) \\
\hline
\end{tabular}
\[
\text { cost of } \sigma_{\mathrm{a}=\mathrm{v}}(\mathrm{R})=\text { ? }
\]
- Table scan: \(B(R)=2,000\) I/Os
- Index based selection:
- If index is clustered:
- If index is unclustered:

\section*{Index Based Selection}
- Example: \(\begin{aligned} & B(R)=2000 \\ & T(R)=100,000 \\ & V(R, a)=20\end{aligned}\)
\[
\text { cost of } \sigma_{a=v}(\mathrm{R})=\text { ? }
\]
- Table scan: \(B(R)=2,000\) I/Os
- Index based selection:
- If index is clustered: \(B(R)\) * \(1 / V(R, a)=100\) I/Os
- If index is unclustered:

\section*{Index Based Selection}
- Example: \(\begin{aligned} & \mathrm{B}(\mathrm{R})=2000 \\ & T(R)=100,000 \\ & \mathrm{~V}(\mathrm{R}, \mathrm{a})=20\end{aligned}\)
\[
\text { cost of } \sigma_{a=v}(\mathrm{R})=\text { ? }
\]
- Table scan: \(B(R)=2,000\) I/Os
- Index based selection:
- If index is clustered: \(B(R)\) * \(1 / V(R, a)=100\) I/Os
- If index is unclustered: \(T(R) * 1 / V(R, a)=5,000\) I/Os

\section*{Index Based Selection}
- Example: \(\begin{aligned} & B(R)=2000 \\ & T(R)=100,000 \\ & V(R, a)=20\end{aligned}\)
\[
\text { cost of } \sigma_{a=v}(\mathrm{R})=\text { ? }
\]
- Table scan: \(B(R)=2,000\) I/Os
- Index based selection:
- If index is clustered: \(B(R)\) * \(1 / V(R, a)=100 I / O s\)
- If index is unclustered: \(T(R) * 1 / V(R, a)=5,000 I / O s\)

Lesson: Don't build unclustered indexes when \(\mathrm{V}(\mathrm{R}, \mathrm{a})\) is small !

\section*{Cost of Executing Operators (Focus on Joins)}

\section*{Outline}
- Join operator algorithms
- One-pass algorithms (Sec. 15.2 and 15.3)
- Index-based algorithms (Sec 15.6)
- Note about readings:
- In class, we discuss only algorithms for joins
- Other operators are easier: read the book

\section*{Join Algorithms}
- Nested loop join
- Hash join
- Sort-merge join
- Index-join

\section*{Join Example}

Patient(pid, name, address)
Insurance(pid, provider, policy_nb)

\section*{Patient \(\bowtie\) Insurance}

\author{
Two tuples per page
}

Patient
\begin{tabular}{|l|l|l|}
\hline 1 & 'Bob' & 'Seattle' \\
\hline 2 & 'Ela' & 'Everett' \\
\hline
\end{tabular}
\begin{tabular}{|l|l|c|}
\hline 3 & 'Jill' & 'Kent' \\
\hline 4 & 'Joe' & 'Seattle' \\
\hline
\end{tabular}

\section*{Insurance}
\begin{tabular}{|c|c|c|}
\hline 2 & 'Blue' & 123 \\
\hline 4 & 'Prem' & 432 \\
\hline 4 & 'Prem' & 343 \\
\hline 3 & 'GrpH' & 554 \\
\hline
\end{tabular}

\section*{Nested Loop Joins}
- Tuple-based nested loop \(R \bowtie S\)
- \(R\) is the outer relation, \(S\) is the inner relation
```

for each tuple t}\mp@subsup{t}{1}{}\mathrm{ in R do
for each tuple t in S do
if }\mp@subsup{t}{1}{}\mathrm{ and }\mp@subsup{t}{2}{}\mathrm{ join then output ( }\mp@subsup{t}{1}{},\mp@subsup{t}{2}{}

```

\section*{What is the Cost?}

\section*{Nested Loop Joins}
- Tuple-based nested loop \(R \bowtie S\)
- \(R\) is the outer relation, \(S\) is the inner relation
```

for each tuple t in R do
for each tuple t in S do
if }\mp@subsup{t}{1}{}\mathrm{ and }\mp@subsup{t}{2}{}\mathrm{ join then output ( }\mp@subsup{t}{1}{},\mp@subsup{t}{2}{}

```
- Cost: \(B(R)+T(R) B(S)\)

What is the Cost?
- Multiple-pass since \(S\) is read many times

\section*{Page-at-a-time Refinement}
for each page of tuples \(r\) in \(R\) do
for each page of tuples \(s\) in \(S\) do
for all pairs of tuples \(t_{1}\) in \(r, t_{2}\) in \(s\)
if \(t_{1}\) and \(t_{2}\) join then output \(\left(t_{1}, t_{2}\right)\)
- Cost: \(B(R)+B(R) B(S)\)

What is the Cost?

\section*{Page-at-a-time Refinement}

\section*{Page-at-a-time Refinement}

\section*{Page-at-a-time Refinement}

\section*{Disk}

Patient Insurance
\begin{tabular}{|l|l|}
\hline 1 & 2 \\
\hline 3 & 4 \\
\hline 9 & 6 \\
\hline 8 & 5 \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline 2 & 4 \\
\hline 4 & 3 \\
\hline 2 & 8 \\
\hline 8 & 9 \\
\hline
\end{tabular}

12 Input buffer for Patient
\begin{tabular}{l|l|l}
2 & 8 & Input buffer for Insurance
\end{tabular}
Keep going until read all of Insurance

\section*{22}

Output buffer
Then repeat for next page of Patient... until end of Patient

Cost: \(B(R)+B(R) B(S)\)

\section*{Block-Nested-Loop Refinement}
for each group of \(\mathrm{M}-1\) pages \(r\) in \(R\) do
for each page of tuples \(s\) in S do
for all pairs of tuples \(t_{1}\) in \(r, t_{2}\) in \(s\) if \(t_{1}\) and \(t_{2}\) join then output \(\left(t_{1}, t_{2}\right)\)
- Cost: \(B(R)+B(R) B(S) /(M-1)\)

What is the Cost?

\section*{Hash Join}

Hash join: \(R \bowtie S\)
- Scan R, build buckets in main memory
- Then scan \(S\) and join
- Cost: \(B(R)+B(S)\)
- Which relation to build the hash table on?

\section*{Hash Join}

Hash join: \(R \bowtie S\)
- Scan R, build buckets in main memory
- Then scan \(S\) and join
- Cost: \(B(R)+B(S)\)
- Which relation to build the hash table on?
- One-pass algorithm when \(B(R) \leq M\)
\(-M=\) number of memory pages available

\section*{Hash Join Example}

Patient \(\bowtie\) Insurance
Some largeenough \#

Memory \(\mathrm{M}=21\) pages

Patient Insurance
\begin{tabular}{|c|c|c|c|c|c|}
\hline 1 & 2 & 2 & 4 & 6 & 6 \\
\hline 3 & 4 & 4 & 3 & 1 & 3 \\
\hline 9 & 6 & 2 & 8 & & \\
\hline 8 & 5 & 8 & 9 & & \\
\hline
\end{tabular}

This is one page with two tuples

\section*{Hash Join Example}

Step 1: Scan Patient and build hash table in memory

Can be done in method open()

Memory M = 21 pages
Hash h: pid \% 5

Disk
Patient Insurance
\begin{tabular}{|c|c|c|c|c|}
\hline \multicolumn{5}{|c|}{Disk} \\
\hline \multicolumn{5}{|l|}{Patient Insurance} \\
\hline 2 & 2 & 4 & 6 & 6 \\
\hline 34 & 4 & 3 & 1 & 3 \\
\hline 96 & 2 & 8 & & \\
\hline 85 & 8 & 9 & & \\
\hline
\end{tabular}

\section*{Hash Join Example}

Step 2: Scan Insurance and probe into hash table Done during calls to next()

Memory M = 21 pages
Hash h: pid \% 5

Disk
Patient Insurance
\begin{tabular}{|c|c|c|c|c|}
\hline \multicolumn{5}{|c|}{Disk} \\
\hline \multicolumn{5}{|l|}{Patient Insurance} \\
\hline 2 & 2 & 4 & 6 & 6 \\
\hline 34 & 4 & 3 & 1 & 3 \\
\hline 96 & 2 & 8 & & \\
\hline \begin{tabular}{l|l|}
\hline 8 & 5 \\
\hline
\end{tabular} & 8 & 9 & & \\
\hline
\end{tabular}

\section*{Hash Join Example}

Step 2: Scan Insurance and probe into hash table Done during calls to next()

Memory M = 21 pages
Hash h: pid \% 5

Disk
Patient Insurance
\begin{tabular}{|l|l|l|l|l|l|}
\hline 1 & 2 & 2 & 2 & 6 & 6 \\
\hline 3 & 4 & 4 & 4 & 3 & 1 \\
\hline 9 & 3 & 3 \\
\hline 9 & 6 & 2 & 8 & & \\
\hline 8 & 5 & 8 & 8 & 9 & \\
\hline & & & \\
\hline
\end{tabular}

\section*{24}

Input buffer
\[
44
\]

Output buffer

\section*{Hash Join Example}

Step 2: Scan Insurance and probe into hash table Done during calls to next()

Memory M = 21 pages
Hash h: pid \% 5

Disk
Patient Insurance
\begin{tabular}{|c|c|c|c|c|c|}
\hline 1 & 2 & 2 & 4 & 6 & 6 \\
\hline 3 & 4 & 4 & 3 & 1 & 3 \\
\hline 9 & 6 & 2 & 8 & & \\
\hline 8 & 5 & 8 & 9 & & \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline 4 & 3 \\
\hline
\end{tabular}

Input buffer
Keep going until read all of Insurance

Cost: \(B(R)+B(S)\)

\section*{Sort-Merge Join}

Sort-merge join: \(R \bowtie S\)
- Scan R and sort in main memory
- Scan \(S\) and sort in main memory
- Merge \(R\) and \(S\)
- Cost: \(B(R)+B(S)\)
- One pass algorithm when \(B(S)+B(R)<=M\)
- Typically, this is NOT a one pass algorithm

\section*{Sort-Merge Join Example}

Step 1: Scan Patient and sort in memory
Memory \(\mathrm{M}=21\) pages
\[
\begin{array}{|l|l|l|l|l|l|l|l|}
\hline 1 & 2 & 3 & 4 & 5 & 6 & 8 & 9 \\
\hline
\end{array}
\]

Disk
Patient Insurance

\section*{Sort-Merge Join Example}

Step 2: Scan Insurance and sort in memory
Memory M = 21 pages
\begin{tabular}{|l|l|l|l|l|l|l|l|}
\hline 1 & 2 & 3 & 4 & 5 & 6 & 8 & 9 \\
\hline
\end{tabular}
\begin{tabular}{|l|l|l|l|l|l|l|l|}
\hline 1 & 2 & 2 & 3 & 3 & 4 & 4 & 6 \\
\hline
\end{tabular}
\begin{tabular}{l|l|l|l|}
\hline 6 & 8 & 8 & 9 \\
\hline
\end{tabular}

\section*{Sort-Merge Join Example}

Step 3: Merge Patient and Insurance
Memory M = 21 pages

\section*{Sort-Merge Join Example}

Step 3: Merge Patient and Insurance
Memory M = 21 pages
\begin{tabular}{|l|l|l|l|l|}
\hline \multicolumn{5}{|c|}{ Disk } \\
\hline \multicolumn{3}{|c|}{ Patient } & \multicolumn{2}{|c|}{ Insurance } \\
\hline 1 & 2 & 2 & 4 & 6 \\
\hline
\end{tabular}

\section*{Index Join}
\(R \bowtie S\)
- Assume \(S\) has an index on the join attribute
- Iterate over R, for each tuple fetch corresponding tuple(s) from S
- Cost:
- If index on \(S\) is clustered:
\[
B(R)+T(R) *(B(S) * 1 / V(S, a))
\]
- If index on \(S\) is unclustered:
\(B(R)+T(R)\) * \((T(S) * 1 / V(S, a))\)

\section*{Cost of Query Plans Example}

Supplier(sid, sname, scity, sstate)
Supply(sid, pno, quantity)

\section*{Logical Query Plan 1}

```

SELECT sname
FROM Supplier x, Supply y
WHERE x.sid = y.sid
and y.pno = 2
and x.scity = 'Seattle'
and x.sstate = 'WA'

```

\section*{Query Optimizer Summary}
- Input: A logical query plan
- Output: A good physical query plan
- Basic query optimization algorithm
- Enumerate alternative plans (logical and physical)
- Compute estimated cost of each plan
- Choose plan with lowest cost
- This is called cost-based optimization```
