Administrivia

- ❖ Homework 1 due Friday @ 5pm
 - Still submit electronically via the Dropbox
- ❖ Lab 2 released, due next Friday
- ❖ Midterm is 2 weeks from today, in lecture
 - You will be provided a reference sheet
 - Study and use this NOW so you are comfortable with it when the exam comes around
 - Find a study group! Look at past exams (last 3 quarters especially)!

Peer Instruction Question

- ❖ Which conditional statement properly fills in the following blank?
 - Vote at <http://PollEv.com/justinh>

```
if( _____ ) { ... } else { ... }
```

```
cmpq    $1, %rsi      # %rsi = j
setg    %dl           # %dl  =
cmpq    %rdi, %rsi    # %rdi = i
setl    %al           # %al  =
orb     %al, %dl       # arithmetic operation
je      .else          #      sets flags!
```

- (A) $j > 1 \text{ || } j < i$ (C) $j \leq 1 \text{ || } j \geq i$
(B) $j > 1 \text{ \&& } j < i$ (D) $j \leq 1 \text{ \&& } j \geq i$

Jumping

❖ j* Instructions

- Jumps to **target** (argument – actually just an address)
- Conditional jump relies on special *condition code registers*

Instruction	Condition	Description
je target	ZF	Equal / Zero
jne target	~ZF	Not Equal / Not Zero
js target	SF	Negative
jns target	~SF	Nonnegative
jg target	~(SF [^] OF) & ~ZF	Greater (Signed)
jge target	~(SF [^] OF)	Greater or Equal (Signed)
jl target	(SF [^] OF)	Less (Signed)
jle target	(SF [^] OF) ZF	Less or Equal (Signed)
ja target	~CF & ~ZF	Above (unsigned)
jb target	CF	Below (unsigned)

x86 Control Flow

- ❖ Condition codes
- ❖ Conditional and unconditional branches
- ❖ Loops
- ❖ Switches

Expressing with Goto Code

```
long absdiff(long x, long y)
{
    long result;
    if (x > y)
        result = x-y;
    else
        result = y-x;
    return result;
}
```

```
long absdiff_j(long x, long y)
{
    long result;
    int ntest = x <= y;
    if (ntest) goto Else;
    result = x-y;
    goto Done;
Else:
    result = y-x;
Done:
    return result;
}
```

- ❖ Allows `goto` as means of transferring control (`jump`)
 - Closer to assembly programming style
 - Generally considered bad coding style

Compiling Loops

C/Java code:

```
while ( sum != 0 ) {  
    <loop body>  
}
```

Assembly code:

```
loopTop:    testq %rax, %rax  
            je    loopDone  
            <loop body code>  
            jmp   loopTop  
  
loopDone:
```

- ❖ Other loops compiled similarly
 - Will show variations and complications in coming slides, but may skip a few examples in the interest of time
- ❖ Most important to consider:
 - When should conditionals be evaluated? (*while* vs. *do-while*)
 - How much jumping is involved?

Compiling Loops

C/Java code:

```
while ( Test ) {  
    Body  
}
```

Goto version

```
Loop: if ( !Test ) goto Exit;  
      Body  
      goto Loop;  
Exit:
```

- ❖ What are the Goto versions of the following?
 - Do...while: Test and Body
 - For loop: Init, Test, Update, and Body

Compiling Loops

While loop

C/Java code:

```
while ( sum != 0 ) {  
    <loop body>  
}
```

Assembly code:

```
loopTop:    testq %rax, %rax  
            je     loopDone  
            <loop body code>  
            jmp    loopTop
```

loopDone:

Do-while loop

C/Java code:

```
do {  
    <loop body>  
} while ( sum != 0 )
```

Assembly code:

```
loopTop:  
        <loop body code>  
        testq %rax, %rax  
        jne    loopTop
```

loopDone:

Do-While Loop Example

C Code

```
long pcount_do(unsigned long x)
{
    long result = 0;
    do {
        result += x & 0x1;
        x >>= 1;
    } while (x);
    return result;
}
```

Goto Version

```
long pcount_goto(unsigned long x)
{
    long result = 0;
loop:
    result += x & 0x1;
    x >>= 1;
    if(x) goto loop;
    return result;
}
```

- ❖ Count number of 1's in argument x (“popcount”)
- ❖ Use backward branch to continue looping
- ❖ Only take branch when “while” condition holds

Do-While Loop Compilation

Register	Use(s)
%rdi	1 st argument (x)
%rax	ret val (result)

Assembly

```
    movl    $0, %eax      # result = 0
.L2:
    movq    %rdi, %rdx
    andl    $1, %edx      # t = x & 0x1
    addq    %rdx, %rax    # result += t
    shrq    %rdi          # x >>= 1
    jne     .L2            # if (x) goto loop
    rep ret              # return (rep weird)
```

Goto Version

```
long pcount_goto(unsigned long x)
{
    long result = 0;
loop:
    result += x & 0x1;
    x >>= 1;
    if(x) goto loop;
    return result;
}
```

General Do-While Loop Translation

C Code

```
do  
  Body  
  while (Test);
```

Goto Version

```
loop:  
  Body  
  if (Test)  
    goto loop
```

❖ *Body:* {
 *Statement*₁;
 ...
 *Statement*_n;
}

❖ *Test* returns integer

- = 0 interpreted as false, ≠ 0 interpreted as true

General While Loop - Translation #1

- ❖ “Jump-to-middle” translation
- ❖ Used with –Og

While version

```
while (Test)
    Body
```

Goto Version

```
goto test;
loop:
    Body
test:
    if (Test)
        goto loop;
done:
```

While Loop Example – Translation #1

C Code

```
long pcount_while
(unsigned long x)
{
    long result = 0;
    while (x) {
        result += x & 0x1;
        x >>= 1;
    }
    return result;
}
```

Jump to Middle

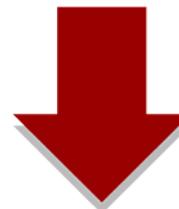

```
long pcount_goto_jtm
(unsigned long x)
{
    long result = 0;
    goto test;
loop:
    result += x & 0x1;
    x >>= 1;
test:
    if (x) goto loop;
    return result;
}
```

- ❖ Used with -Og
- ❖ Compare to do-while version of function
- ❖ Initial goto starts loop at test

General While Loop - Translation #2

While version

```
while (Test)
  Body
```

Do-While Version

```
if (!Test)
  goto done;
do
  Body
  while (Test);
done:
```

- ❖ “Do-while” conversion
- ❖ Used with –O1

Goto Version

```
if (!Test)
  goto done;
loop:
  Body
  if (Test)
    goto loop;
done:
```

While Loop Example – Translation #2

C Code

```
long pcount_while
(unsigned long x)
{
    long result = 0;
    while (x) {
        result += x & 0x1;
        x >>= 1;
    }
    return result;
}
```

Do-While Version

```
long pcount_goto_dw
(unsigned long x)
{
    long result = 0;
    if (!x) goto done;
loop:
    result += x & 0x1;
    x >>= 1;
    if (x) goto loop;
done:
    return result;
}
```

- ❖ Used with -O1
- ❖ Compare to do-while version of function (one less jump?)
- ❖ Initial conditional guards entrance to loop

For Loop Form

General Form

```
for (Init; Test; Update)
```

Body

```
#define WSIZE 8*sizeof(int)
long pcount_for(unsigned long x)
{
    size_t i;
    long result = 0;
    for (i = 0; i < WSIZE; i++) {
        unsigned bit =
            (x >> i) & 0x1;
        result += bit;
    }
    return result;
}
```

Init

```
i = 0
```

Test

```
i < WSIZE
```

Update

```
i++
```

Body

```
{
    unsigned bit =
        (x >> i) & 0x1;
    result += bit;
}
```

For Loop → While Loop

For Version

```
for (Init; Test; Update)
```

Body

While Version

```
Init;
```

```
while (Test) {
```

Body

Update;

```
}
```

Caveat: C and Java have break and continue

- *Conversion works fine for break*
 - *Jump to same label as loop exit condition*
- *But not continue: would skip doing Update, which it should do with for-loops*
 - *Introduce new label at Update*

For Loop - While Conversion

Init

```
i = 0
```

Test

```
i < WSIZE
```

Update

```
i++
```

Body

```
{  
    unsigned bit = (x >> i) & 0x1;  
    result += bit;  
}
```

```
long pcount_for_while(unsigned long x)  
{  
    size_t i;  
    long result = 0;  
    i = 0;  
    while (i < WSIZE) {  
        unsigned bit = (x >> i) & 0x1;  
        result += bit;  
        i++;  
    }  
    return result;  
}
```

For Loop - Do-While Conversion

C Code

```
long pcount_for
(unsigned long x)
{
    size_t i;
    long result = 0;
    for (i = 0; i < WSIZE; i++)
    {
        unsigned bit =
            (x >> i) & 0x1;
        result += bit;
    }
    return result;
}
```

Goto Version

```
long pcount_for_goto_dw
(unsigned long x)
{
    size_t i;
    long result = 0;
    i = 0;
    if (!(i < WSIZE))
        goto done;
loop:
    unsigned bit =
        (x >> i) & 0x1;
    result += bit;
    i++;
    if (i < WSIZE)
        goto loop;
done:
    return result;
}
```

Init

!Test

Body

Update

Test

- ❖ Initial test can be optimized away!

x86 Control Flow

- ❖ Condition codes
- ❖ Conditional and unconditional branches
- ❖ Loops
- ❖ Switches

```
long switch_ex
  (long x, long y, long z)
{
    long w = 1;
    switch (x) {
        case 1:
            w = y*z;
            break;
        case 2:
            w = y/z;
        /* Fall Through */
        case 3:
            w += z;
            break;
        case 5:
        case 6:
            w -= z;
            break;
        default:
            w = 2;
    }
    return w;
}
```

Switch Statement Example

- ❖ Multiple case labels
 - Here: 5 & 6
- ❖ Fall through cases
 - Here: 2
- ❖ Missing cases
 - Here: 4
- ❖ Implemented with:
 - *Jump table*
 - *Indirect jump instruction*

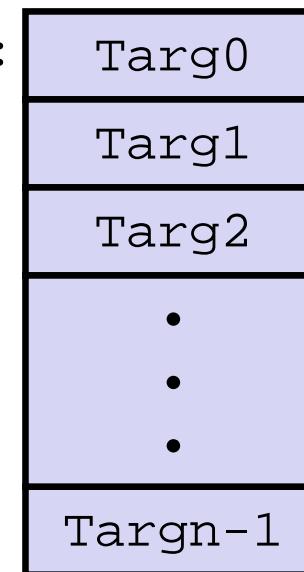

Jump Table Structure

Switch Form

```
switch (x) {  
    case val_0:  
        Block 0  
    case val_1:  
        Block 1  
    • • •  
    case val_n-1:  
        Block n-1  
}
```

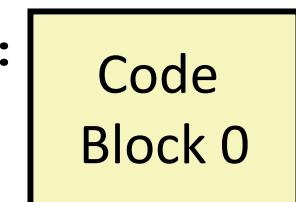

JTab:

Jump Table

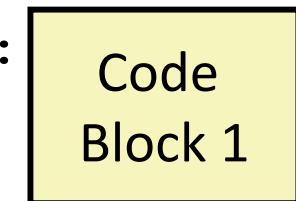

Jump Targets

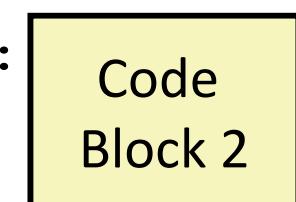

Targ0:

Targ1:

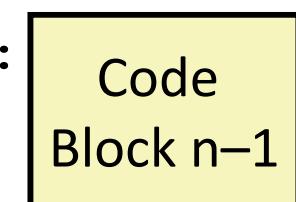

Targ2:

•
•
•

Targn-1:

Approximate Translation

```
target = JTab[x];  
goto target;
```

Jump Table Structure

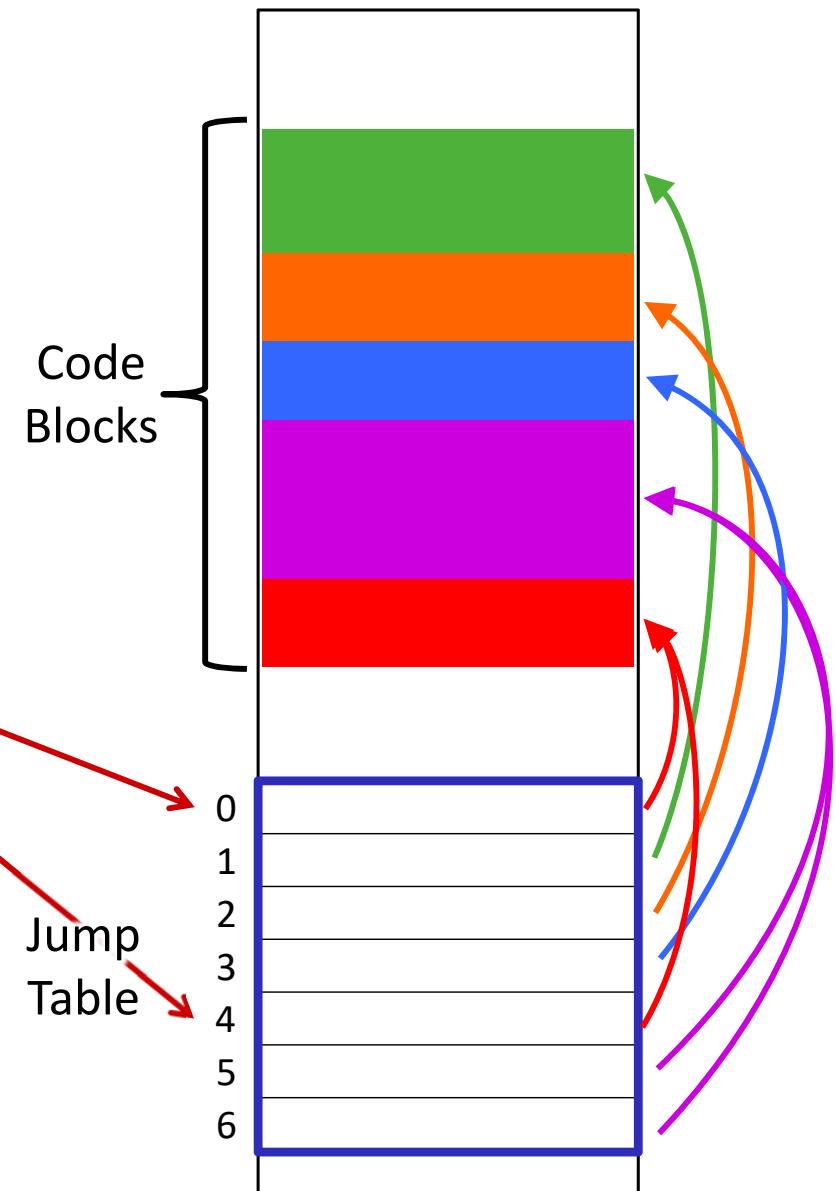

C code:

```
switch (x) {  
    case 1: <some code>  
              break;  
    case 2: <some code>  
    case 3: <some code>  
              break;  
    case 5:  
    case 6: <some code>  
              break;  
    default: <some code>  
}
```

Use the jump table when $x \leq 6$:

```
if (x <= 6)  
    target = JTab[x];  
    goto target;  
else  
    goto default;
```

Memory

Jump Table

Switch Statement Example

```
long switch_ex(long x, long y, long z)
{
    long w = 1;
    switch (x) {
        . . .
    }
    return w;
}
```

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rdx	3 rd argument (z)
%rax	Return value

Note compiler chose
to not initialize w

```
switch_eg:
    movq    %rdx, %rcx
    cmpq    $6, %rdi      # x:6
    ja     .L8           # default
    jmp    * .L4(,%rdi,8) # jump table
```

Take a look!
<https://godbolt.org/g/NAxYVw>

jump above – unsigned > catches negative default cases

Switch Statement Example

```
long switch_ex(long x, long y, long z)
{
    long w = 1;
    switch (x) {
        . . .
    }
    return w;
}
```

```
switch_eg:
    movq    %rdx, %rcx
    cmpq    $6, %rdi      # x:6
    ja     .L8            # default
    jmp    * .L4(,%rdi,8) # jump table
```

*Indirect
jump*

Jump table

```
.section .rodata
.align 8
.L4:
    .quad .L8    # x = 0
    .quad .L3    # x = 1
    .quad .L5    # x = 2
    .quad .L9    # x = 3
    .quad .L8    # x = 4
    .quad .L7    # x = 5
    .quad .L7    # x = 6
```

Assembly Setup Explanation

❖ Table Structure

- Each target requires 8 bytes (address)
- Base address at .L4

❖ Direct jump: `jmp .L8`

- Jump target is denoted by label .L8

❖ Indirect jump: `jmp * .L4(, %rdi , 8)`

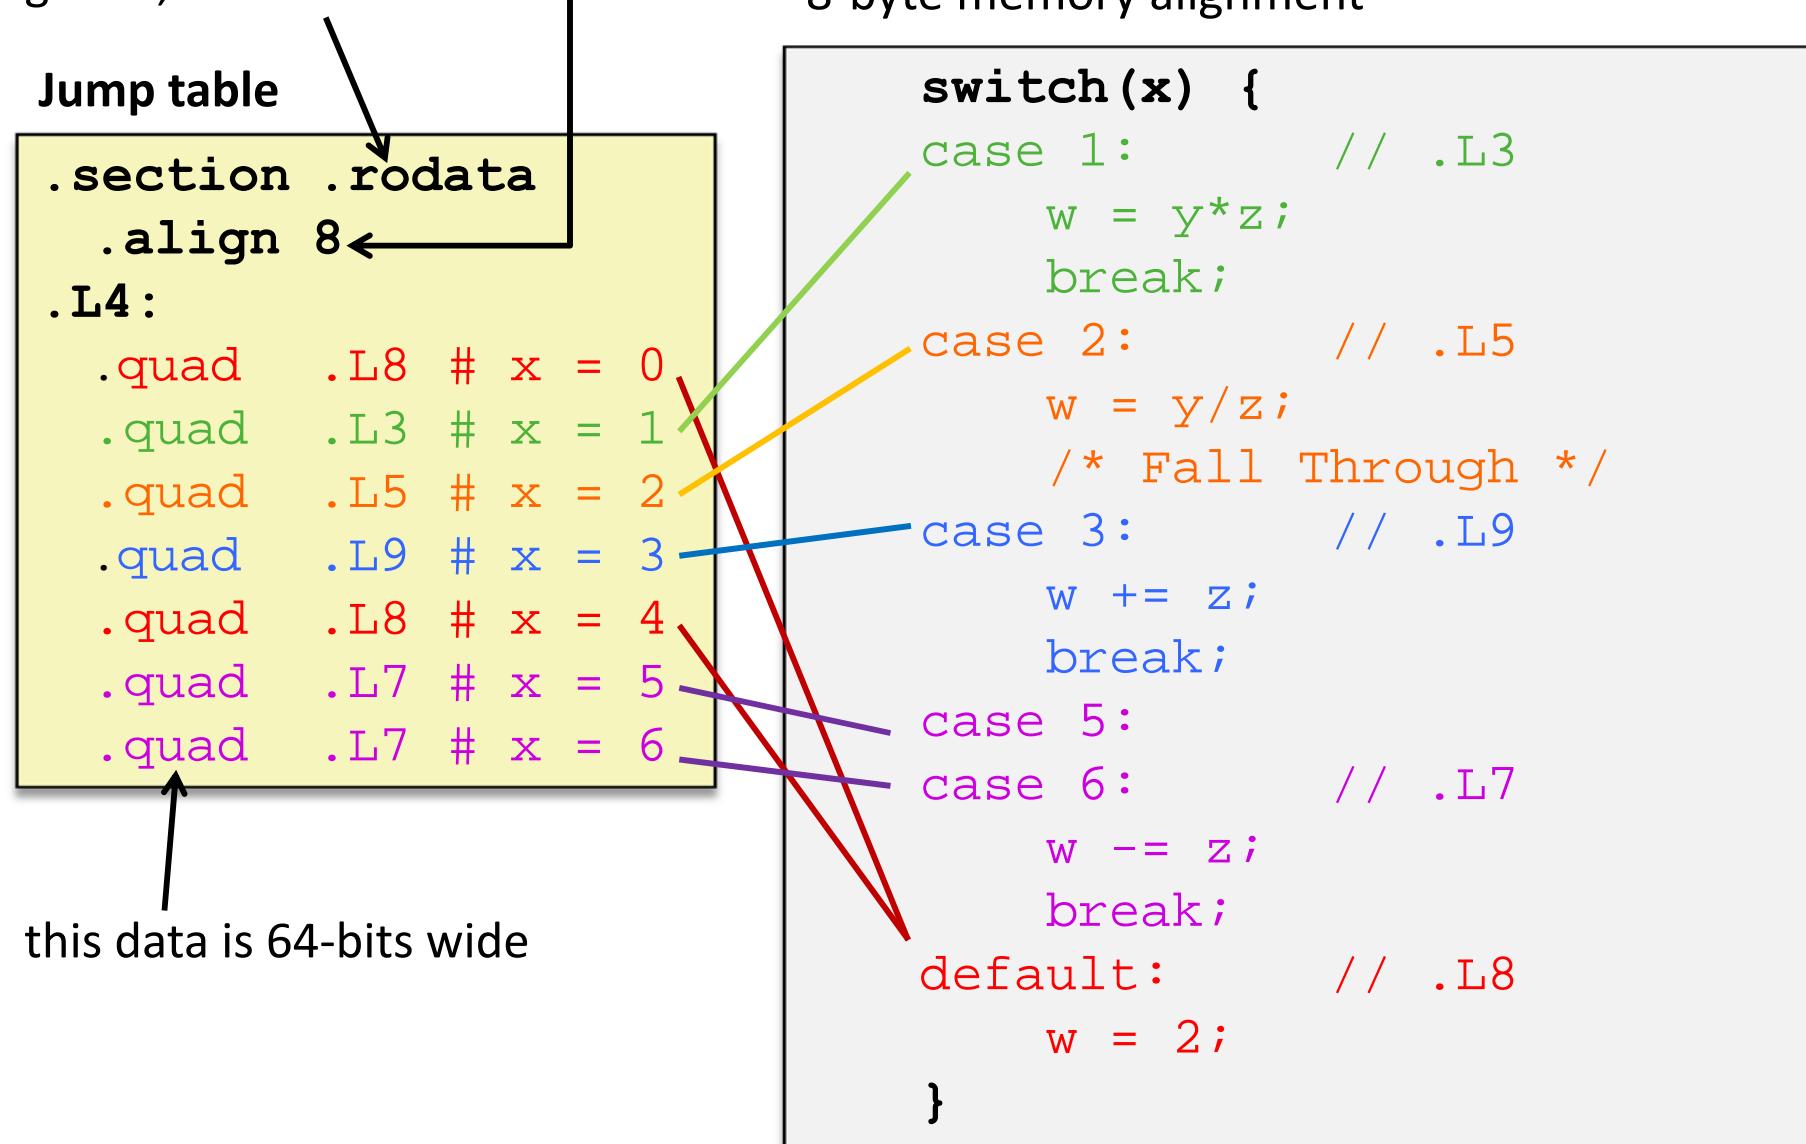

- Start of jump table: .L4
- Must scale by factor of 8 (addresses are 8 bytes)
- Fetch target from effective address .L4 + x*8
 - Only for $0 \leq x \leq 6$

Jump table

```
.section    .rodata
.align 8
.L4:
.quad     .L8    # x = 0
.quad     .L3    # x = 1
.quad     .L5    # x = 2
.quad     .L9    # x = 3
.quad     .L8    # x = 4
.quad     .L7    # x = 5
.quad     .L7    # x = 6
```

Jump Table

declaring data, not instructions

Code Blocks ($x == 1$)

```
switch(x) {  
    case 1: // .L3  
        w = y*z;  
        break;  
        . . .  
}
```

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rdx	3 rd argument (z)
%rax	Return value

```
.L3:  
    movq    %rsi, %rax    # y  
    imulq   %rdx, %rax    # y*z  
    ret
```

Handling Fall-Through

```
long w = 1;  
.  
.  
switch (x) {  
.  
.  
case 2: // .L5  
    w = y/z;  
    /* Fall Through */  
case 3: // .L9  
    w += z;  
    break;  
.  
.  
}
```

case 2:

```
w = y/z;  
goto merge;
```

case 3:

```
w = 1;
```

merge:

```
w += z;
```

*More complicated choice than
“just fall-through” forced by
“migration” of w = 1;*

- *Example compilation trade-off*

Code Blocks ($x == 2$, $x == 3$)

```

long w = 1;
. . .
switch (x) {
. . .
case 2: // .L5
    w = y/z;
    /* Fall Through */
case 3: // .L9
    w += z;
    break;
. . .
}

```

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rdx	3 rd argument (z)
%rax	Return value

```

.L5:                                # Case 2
    movq    %rsi, %rax   # y in rax
    cqto
    idivq   %rcx        # y/z
    jmp     .L6          # goto merge
.L9:                                # Case 3
    movl    $1, %eax    # w = 1
.L6:                                # merge:
    addq    %rcx, %rax   # w += z
    ret

```

Code Blocks (rest)

```
switch (x) {  
    . . .  
    case 5: // .L7  
    case 6: // .L7  
        w -= z;  
        break;  
    default: // .L8  
        w = 2;  
}
```

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rdx	3 rd argument (z)
%rax	Return value

```
.L7:                      # Case 5,6  
    movl $1, %eax      # w = 1  
    subq %rdx, %rax   # w -= z  
    ret  
.L8:                      # Default:  
    movl $2, %eax      # 2  
    ret
```

Question

- ❖ Would you implement this with a jump table?

```
switch (x) {  
    case 0:      <some code>  
        break;  
    case 10:     <some code>  
        break;  
    case 32767:  <some code>  
        break;  
    default:    <some code>  
        break;  
}
```

- ❖ Probably not
 - 32,768-entry jump table too big (256 KiB) for only 4 cases
 - For comparison, text of this switch statement 193 B

BONUS SLIDES

Bonus content (nonessential). Does contain examples.

- ❖ Conditional Operator with Jumps
- ❖ Conditional Move

Conditional Operator with Jumps

Bonus Content
(nonessential)

C Code

```
val = Test ? Then-Expr : Else-Expr;
```

Example:

```
result = x>y ? x-y : y-x;
```

Goto Version

```
ntest = !Test;
if (ntest) goto Else;
val = Then_Expr;
goto Done;
Else:
    val = Else_Expr;
Done:
    . . .
```

```
if (Test)
    val = Then-Expr;
else
    val = Else-Expr;
```

- Ternary operator ?:
 - *Test* is expression returning integer
 - = 0 interpreted as false
 - ≠ 0 interpreted as true
 - Create separate code regions for then & else expressions
 - Execute appropriate one

Conditional Move

- ❖ Conditional Move Instructions: **cmovC** src, dst

- Move value from src to dst if condition **C** holds
- $\text{if}(\text{Test}) \text{ Dest} \leftarrow \text{Src}$
- GCC tries to use them (but only when known to be **safe**)

- ❖ Why is this useful?

- Branches are very disruptive to instruction flow through *pipelines*
- Conditional moves do not require control transfer

```
long absdiff(long x, long y)
{
    return x>y ? x-y : y-x;
}
```

absdiff:

movq	%rdi, %rax # x
subq	%rsi, %rax # result=x-y
movq	%rsi, %rdx
subq	%rdi, %rdx # else_val=y-x
cmpq	%rsi, %rdi # x:y
cmovle	%rdx, %rax # if <=,
ret	# result=else_val

Bonus Content
(nonessential)
*more details at
end of slides*

Using Conditional Moves

Bonus Content
(nonessential)

- ❖ Conditional Move Instructions
 - `cmovC src, dest`
 - Move value from src to dest if condition C holds
 - Instruction supports:
 $\text{if } (\text{Test}) \text{ Dest} \leftarrow \text{Src}$
 - Supported in post-1995 x86 processors
 - GCC tries to use them
 - But, only when known to be **safe**
- ❖ Why is this useful?
 - Branches are very disruptive to instruction flow through pipelines
 - Conditional moves do not require control transfer

C Code

```
val = Test
      ? Then_Expr
      : Else_Expr;
```

“Goto” Version

```
result = Then_Expr;
else_val = Else_Expr;
nt = !Test;
if (nt) result = else_val;
return result;
```

Conditional Move Example

Bonus Content
(nonessential)

```
long absdiff(long x, long y)
{
    long result;
    if (x > y)
        result = x-y;
    else
        result = y-x;
    return result;
}
```

Register	Use(s)
%rdi	Argument x
%rsi	Argument y
%rax	Return value

absdiff:

```
    movq    %rdi, %rax      # x
    subq    %rsi, %rax      # result = x-y
    movq    %rsi, %rdx
    subq    %rdi, %rdx      # else_val = y-x
    cmpq    %rsi, %rdi      # x:y
    cmovle %rdx, %rax      # if <=, result = else_val
    ret
```

Bad Cases for Conditional Move

Bonus Content
(nonessential)

Expensive Computations

```
val = Test(x) ? Hard1(x) : Hard2(x);
```

- ❖ Both values get computed
- ❖ Only makes sense when computations are very simple

Risky Computations

```
val = p ? *p : 0;
```

- Both values get computed
- May have undesirable effects

Computations with side effects

```
val = x > 0 ? x*=7 : x+=3;
```

- Both values get computed
- Must be side-effect free
