CSE 351 Section 2 - Pointers and Bit Operators

Welcome back to section!

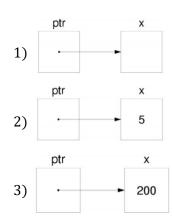

Pointers

C uses pointers explicitly. If we have a variable x, then &x gives the address of x rather than the value of x. If we have a pointer p, then *p gives us the value that p points to, rather than the value of p.

Consider the following declarations and assignments:

```
int x;
int *ptr;
ptr = &x;
```

- 1) We can represent the result above three lines of code graphically as shown. The variable ptr stores the address of x. Essentially, ptr "points" to x. x currently doesn't contain a value since we did not assign x a value!
- 2) After executing x = 5; the memory diagram changes as shown.
- 3) After executing *ptr = 200;, the memory diagram changes as shown. We modified the value of x by dereferencing ptr.

Pointer Arithmetic

Arithmetic on pointers (this is a C concept) is scaled by the size of the target type. That is, if p is declared as some pointer **type*** p, then the operation p + i will actually change the data stored in p (an address) by i*sizeof(type) (in bytes). However, *p returns the data *pointed at* by p, so pointer arithmetic only applies if p was a pointer to a pointer.

Exercise:

Draw out the memory diagram after sequential execution of each of the lines of the function below:

<pre>int main(int argc, char</pre>	**argv) {
int $x = 410$, $y = 350$;	// assume &x = 0x10
<pre>int *p = &x</pre>	<pre>// p is a pointer to an integer</pre>
*p = y;	
p = p + 4;	
p = &y	
x = *p + 1;	
}

C Bitwise Operators

```
      &
      0
      1
      ←
      AND (&) outputs a 1 only when both input bits are 1.

      1
```

Masking is very commonly used with bitwise operations. A mask is a binary constant used to manipulate another bit string in a specific manner, such as setting specific bits to 1 or 0.

Exercises:

1) What happens when we fix/set one of the inputs to the 2-input gates? Let x be the other input. Fill in the following blanks with either 0, 1, x, or \bar{x} (NOT x):

2) **Lab 1 Helper Exercises:** Lab 1 is intended to familiarize you with bitwise operations in C through a series of puzzles. These exercises are either sub-problems directly from the lab or expose concepts needed to complete the lab. Start early!

Bit Extraction: Returns the value (0 or 1) of the 19 th bit (counting from LSB). Allowed operators: >>, &, , \sim .		
<pre>int extract19(int x) {</pre>		
return	į	
Subtraction: Returns the value of $x-y$. Allowed operators: >>, &, , ~, +.		
<pre>int subtract(int x, int y) {</pre>		
return	<i>;</i>	
Equality: Returns the value of $x==y$. Allowed operators: >>, &, , ~, +, ^, !.		
<pre>int equals(int x, int y) {</pre>		
return	;	
}		
Greater than Zero? Returns the value of $x>0$. Allowed operators: $>>$, &, , \sim , +, $^{\wedge}$, !.		
<pre>int greater_than_0(int x) {</pre>		
return	<i>;</i>	
}		
Divisible by Eight? Returns the value of $(x\%8)==0$. Allowed operators: >>, <<, &, , ~, +, ^, !.		
<pre>int divisible_by_8(int x) {</pre>		
return	<i>;</i>	
}
