

x86-64 Programming I

CSE 351 Spring 2018

<http://www.smbc-comics.com/?id=2999>

Administrivia

- ❖ Continue to check the course calendar please 😊

Review: Operand types

- ❖ **Immediate:** Constant integer data
 - Examples: **\$0x400**, **\$-533**
 - Like C literal, but prefixed with **'\$'**
 - Encoded with 1, 2, 4, or 8 bytes
depending on the instruction
- ❖ **Register:** 1 of 16 integer registers
 - Examples: **%rax**, **%r13**
 - But **%rsp** reserved for special use
 - Others have special uses for particular instructions
- ❖ **Memory:** Consecutive bytes of memory at a computed address
 - Simplest example: **(%rax)**
 - Various other “address modes”

%rax**%rcx****%rdx****%rbx****%rsi****%rdi****%rsp****%rbp****%rN**

Moving Data

- ❖ General form: `mov_ source, destination`
 - Missing letter (`_`) specifies size of operands
 - Note that due to backwards-compatible support for 8086 programs (16-bit machines!), “word” means 16 bits = 2 bytes in x86 instruction names
 - Lots of these in typical code
- ❖ `movb src, dst`
 - Move 1-byte “byte”
- ❖ `movw src, dst`
 - Move 2-byte “word”
- ❖ `movl src, dst`
 - Move 4-byte “long word”
- ❖ `movq src, dst`
 - Move 8-byte “quad word”

movq Operand Combinations

	Source	Dest	Src, Dest	C Analog
movq	Imm	Reg	movq \$0x4, %rax	var_a = 0x4;
		Mem	movq \$-147, (%rax)	*p_a = -147;
	Reg	Reg	movq %rax, %rdx	var_d = var_a;
		Mem	movq %rax, (%rdx)	*p_d = var_a;
	Mem	Reg	movq (%rax), %rdx	var_d = *p_a;

❖ *Cannot do memory-memory transfer with a single instruction*

- How would you do it?

x86-64 Introduction

- ❖ Arithmetic operations
- ❖ Memory addressing modes
 - swap example
- ❖ Address computation instruction (leaq)

Some Arithmetic Operations

❖ Binary (two-operand) Instructions:

- **Maximum of one memory operand**

- Beware argument order!
- No distinction between signed and unsigned
 - Only arithmetic vs. logical shifts
- How do you implement “ $r3 = r1 + r2$ ”?

Format	Computation	
addq <i>src, dst</i>	$dst = dst + src$	($dst += src$)
subq <i>src, dst</i>	$dst = dst - src$	
imulq <i>src, dst</i>	$dst = dst * src$	signed mult
sarq <i>src, dst</i>	$dst = dst \gg src$	Arithmetic
shrq <i>src, dst</i>	$dst = dst \gg src$	Logical
shlq <i>src, dst</i>	$dst = dst \ll src$	(same as salq)
xorq <i>src, dst</i>	$dst = dst \wedge src$	
andq <i>src, dst</i>	$dst = dst \& src$	
orq <i>src, dst</i>	$dst = dst src$	

↑ operand size specifier

Some Arithmetic Operations

❖ Unary (one-operand) Instructions:

Format	Computation	
incq <i>dst</i>	$dst = dst + 1$	increment
decq <i>dst</i>	$dst = dst - 1$	decrement
negq <i>dst</i>	$dst = -dst$	negate
notq <i>dst</i>	$dst = \sim dst$	bitwise complement

❖ See CSPP Section 3.5.5 for more instructions: `mulq`, `cqto`, `idivq`, `divq`

Arithmetic Example

```
long simple_arith(long x, long y)
{
    long t1 = x + y;
    long t2 = t1 * 3;
    return t2;
}
```

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rax	return value

```
y += x;
y *= 3;
long r = y;
return r;
```

```
simple_arith:
    addq    %rdi, %rsi
    imulq   $3, %rsi
    movq    %rsi, %rax
    ret
```

Example of Basic Addressing Modes

```
void swap(long *xp, long *yp)
{
    long t0 = *xp;
    long t1 = *yp;
    *xp = t1;
    *yp = t0;
}
```

```
swap:
    movq    (%rdi), %rax
    movq    (%rsi), %rdx
    movq    %rdx, (%rdi)
    movq    %rax, (%rsi)
    ret
```

Understanding swap()

```
void swap(long *xp, long *yp)
{
    long t0 = *xp;
    long t1 = *yp;
    *xp = t1;
    *yp = t0;
}
```

```
swap:
    movq    (%rdi), %rax
    movq    (%rsi), %rdx
    movq    %rdx, (%rdi)
    movq    %rax, (%rsi)
    ret
```

Register		Variable
%rdi	⇔	xp
%rsi	⇔	yp
%rax	⇔	t0
%rdx	⇔	t1

Understanding swap()

Registers

%rdi	0x120
%rsi	0x100
%rax	
%rdx	

Memory

Word Address
123
456

0x120

0x118

0x110

0x108

0x100

swap:

```

movq    (%rdi), %rax    # t0 = *xp
movq    (%rsi), %rdx    # t1 = *yp
movq    %rdx, (%rdi)    # *xp = t1
movq    %rax, (%rsi)    # *yp = t0
ret

```

Understanding swap()

swap:

```
movq    (%rdi), %rax    # t0 = *xp
movq    (%rsi), %rdx    # t1 = *yp
movq    %rdx, (%rdi)    # *xp = t1
movq    %rax, (%rsi)    # *yp = t0
ret
```

Understanding swap()

swap:

```
movq    (%rdi), %rax    # t0 = *xp
movq    (%rsi), %rdx    # t1 = *yp
movq    %rdx, (%rdi)    # *xp = t1
movq    %rax, (%rsi)    # *yp = t0
ret
```

Understanding swap()

swap:

```
movq    (%rdi), %rax    # t0 = *xp
movq    (%rsi), %rdx    # t1 = *yp
movq    %rdx, (%rdi)  # *xp = t1
movq    %rax, (%rsi)    # *yp = t0
ret
```

Understanding swap()

swap:

```
movq    (%rdi), %rax    # t0 = *xp
movq    (%rsi), %rdx    # t1 = *yp
movq    %rdx, (%rdi)    # *xp = t1
movq    %rax, (%rsi)  # *yp = t0
ret
```

Memory Addressing Modes: Basic

❖ Indirect: (R) $\text{Mem}[\text{Reg}[R]]$

- Data in register R specifies the memory address
- Like pointer dereference in C
- Example: `movq (%rcx), %rax`

❖ Displacement: $D(R)$ $\text{Mem}[\text{Reg}[R]+D]$

- Data in register R specifies the *start* of some memory region
- Constant displacement D specifies the offset from that address
- Example: `movq 8(%rbp), %rdx`

Complete Memory Addressing Modes

❖ General:

- $D(Rb, Ri, S)$ $\text{Mem}[\text{Reg}[Rb] + \text{Reg}[Ri] * S + D]$
 - Rb : Base register (any register)
 - Ri : Index register (any register except $\%rsp$)
 - S : Scale factor (1, 2, 4, 8) – *why these numbers?*
 - D : Constant displacement value (a.k.a. immediate)

❖ Special cases (see CSPP Figure 3.3 on p.181)

- $D(Rb, Ri)$ $\text{Mem}[\text{Reg}[Rb] + \text{Reg}[Ri] + D]$ ($S=1$)
- (Rb, Ri, S) $\text{Mem}[\text{Reg}[Rb] + \text{Reg}[Ri] * S]$ ($D=0$)
- (Rb, Ri) $\text{Mem}[\text{Reg}[Rb] + \text{Reg}[Ri]]$ ($S=1, D=0$)
- $(, Ri, S)$ $\text{Mem}[\text{Reg}[Ri] * S]$ ($Rb=0, D=0$)

Address Computation Examples

%rdx	0xf000
%rcx	0x0100

$D(Rb, Ri, S) \rightarrow$
 $Mem[Reg[Rb] + Reg[Ri] * S + D]$

Expression	Address Computation	Address
<code>0x8(%rdx)</code>		
<code>(%rdx,%rcx)</code>		
<code>(%rdx,%rcx,4)</code>		
<code>0x80(,%rdx,2)</code>		

Address Computation Instruction

- ❖ `leaq src, dst`
 - “lea” stands for *load effective address*
 - `src` is address expression (any of the formats we’ve seen)
 - `dst` is a register
 - Sets `dst` to the *address* computed by the `src` expression (*does not go to memory! – it just does math*)
 - Example: `leaq (%rdx,%rcx,4), %rax`
- ❖ Uses:
 - Computing addresses without a memory reference
 - e.g. translation of `p = &x[i];`
 - Computing arithmetic expressions of the form $x + k * i + d$
 - Though k can only be 1, 2, 4, or 8

Example: lea vs. mov

Registers

%rax	
%rbx	
%rcx	0x4
%rdx	0x100
%rdi	
%rsi	

Memory Word Address

0x400	0x120
0xF	0x118
0x8	0x110
0x10	0x108
0x1	0x100

```
leaq (%rdx,%rcx,4), %rax
movq (%rdx,%rcx,4), %rbx
leaq (%rdx), %rdi
movq (%rdx), %rsi
```

Arithmetic Example

```
long arith(long x, long y, long z)
{
    long t1 = x + y;
    long t2 = z + t1;
    long t3 = x + 4;
    long t4 = y * 48;
    long t5 = t3 + t4;
    long rval = t2 * t5;
    return rval;
}
```

```
arith:
    leaq    (%rdi,%rsi), %rax
    addq    %rdx, %rax
    leaq    (%rsi,%rsi,2), %rdx
    salq    $4, %rdx
    leaq    4(%rdi,%rdx), %rcx
    imulq   %rcx, %rax
    ret
```

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rdx	3 rd argument (z)

- ❖ Interesting Instructions
 - leaq: “address” computation
 - salq: shift
 - imulq: multiplication
 - Only used once!

Arithmetic Example

```

long arith(long x, long y, long z)
{
    long t1 = x + y;
    long t2 = z + t1;
    long t3 = x + 4;
    long t4 = y * 48;
    long t5 = t3 + t4;
    long rval = t2 * t5;
    return rval;
}

```

Register	Use(s)
%rdi	x
%rsi	y
%rdx	z, t4
%rax	t1, t2, rval
%rcx	t5

```

arith:
    leaq    (%rdi,%rsi), %rax    # rax/t1    = x + y
    addq    %rdx, %rax          # rax/t2    = t1 + z
    leaq    (%rsi,%rsi,2), %rdx  # rdx      = 3 * y
    salq    $4, %rdx            # rdx/t4    = (3*y) * 16
    leaq    4(%rdi,%rdx), %rcx   # rcx/t5    = x + t4 + 4
    imulq   %rcx, %rax          # rax/rval  = t5 * t2
    ret

```

Peer Instruction Question

❖ Which of the following x86-64 instructions correctly calculates $\text{\%rax} = 9 * \text{\%rdi}$?

- A. `leaq (, %rdi, 9), %rax`
- B. `movq (, %rdi, 9), %rax`
- C. `leaq (%rdi, %rdi, 8), %rax`
- D. `movq (%rdi, %rdi, 8), %rax`
- E. We're lost...

Summary

- ❖ **Memory Addressing Modes:** The addresses used for accessing memory in `MOV` (and other) instructions can be computed in several different ways
 - *Base register, index register, scale factor, and displacement* map well to pointer arithmetic operations
- ❖ `leaq` is address calculation instruction
 - Does NOT actually go to memory
 - Used to compute addresses or some arithmetic expressions
