WHY I TRY NOT TO BE
PEDANTIC ABOUT CONDITIONALS.

<http://xkcd.com/1652/>

Administrative

- ❖ Homework 2 (x86) due Monday (1/29)
- ❖ Lab 2 due next Friday (2/2)
- ❖ Midterm: 2/5
 - You will be provided a fresh reference sheet
 - **Must bring your UW Student ID to the exam!**
 - Topics are Lectures 1 – 12, Ch 1.0 – 3.7
 - Review packet / suggested practice problems to be posted soon

x86 Control Flow

- ❖ Condition codes
- ❖ Conditional and unconditional branches
- ❖ Loops
- ❖ Switches

Expressing with Goto Code

```
long absdiff(long x, long y)
{
    long result;
    if (x > y)
        result = x-y;
    else
        result = y-x;
    return result;
}
```

labels

```
long absdiff_j(long x, long y)
{
    long result;
    int ntest = (x <= y); cmp
    if (ntest) goto Else; jle
    result = x-y;
    goto Done; jmp
Else:
    result = y-x;
Done:
    return result;
}
```

- ❖ C allows goto as means of transferring control (jump)
 - Closer to assembly programming style
 - Generally considered bad coding style

Compiling Loops

C/Java code:

Test

```
while ( sum != 0 ) {  
    <loop body>  
}
```

Assembly code:

```
loopTop:    testq %rax, %rax  
            je    loopDone  
            <loop body code>  
            jmp   loopTop
```

loopDone:

- ❖ Other loops compiled similarly
 - Will show variations and complications in coming slides, but may skip a few examples in the interest of time
- ❖ Most important to consider:
 - When should conditionals be evaluated? (*while* vs. *do-while*)
 - How much jumping is involved?

Compiling Loops

C/Java code:  Goto version

```
while ( Test ) {  
    Body  
}
```

```
Loop: if ( !Test ) goto Exit;  
      Body  
      goto Loop;  
Exit:
```

- ❖ What are the Goto versions of the following?
 - Do...while: Test and Body
 - For loop: Init, Test, Update, and Body

Do...while

```
Loop: Body  
      if (Test) goto Loop;
```

For loop

```
Init  
Loop: if (!Test) goto Exit;  
      Body  
      Update  
      goto Loop;  
Exit:
```

Compiling Loops

While Loop:

C: **while** (sum != 0) {
 <loop body>
 }

Test

x86-64:

```
loopTop: testq %rax, %rax
je loopDone } !Test
<loop body code>
jmp loopTop

loopDone:
```

Do-while Loop:

C: do {
 <loop body>
} **while** (sum != 0)

x86-64:

```
loopTop: <loop body code>
testq %rax, %rax } Test
jne loopTop

loopDone:
```

While Loop (ver. 2):

C: **while** (sum != 0) {
 <loop body>
}

x86-64:

```
loopTop: testq %rax, %rax } !Test
je loopDone

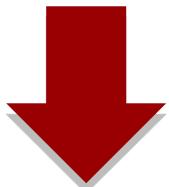

Do-while loop: <loop body code>
testq %rax, %rax } Test
jne loopTop

loopDone:
```

For Loop → While Loop

For Version

```
for (Init; Test; Update)  
    Body
```

While Version

```
Init;  
  
while (Test) {  
    Body  
    Update;  
}
```

Caveat: C and Java have break and continue

- *Conversion works fine for break*
 - *Jump to same label as loop exit condition*
- *But not continue: would skip doing Update, which it should do with for-loops*
 - *Introduce new label at Update*

x86 Control Flow

- ❖ Condition codes
- ❖ Conditional and unconditional branches
- ❖ Loops
- ❖ **Switches**

```
long switch_ex
    (long x, long y, long z)
{
    long w = 1;
    switch (x) {
        case 1:
            w = y*z;
            break;
        case 2:
            w = y/z;
        /* Fall Through */
        case 3:
            w += z;
            break;
        case 5:
        case 6:
            w -= z;
            break;
        default:
            w = 2;
    }
    return w;
}
```

Switch Statement Example

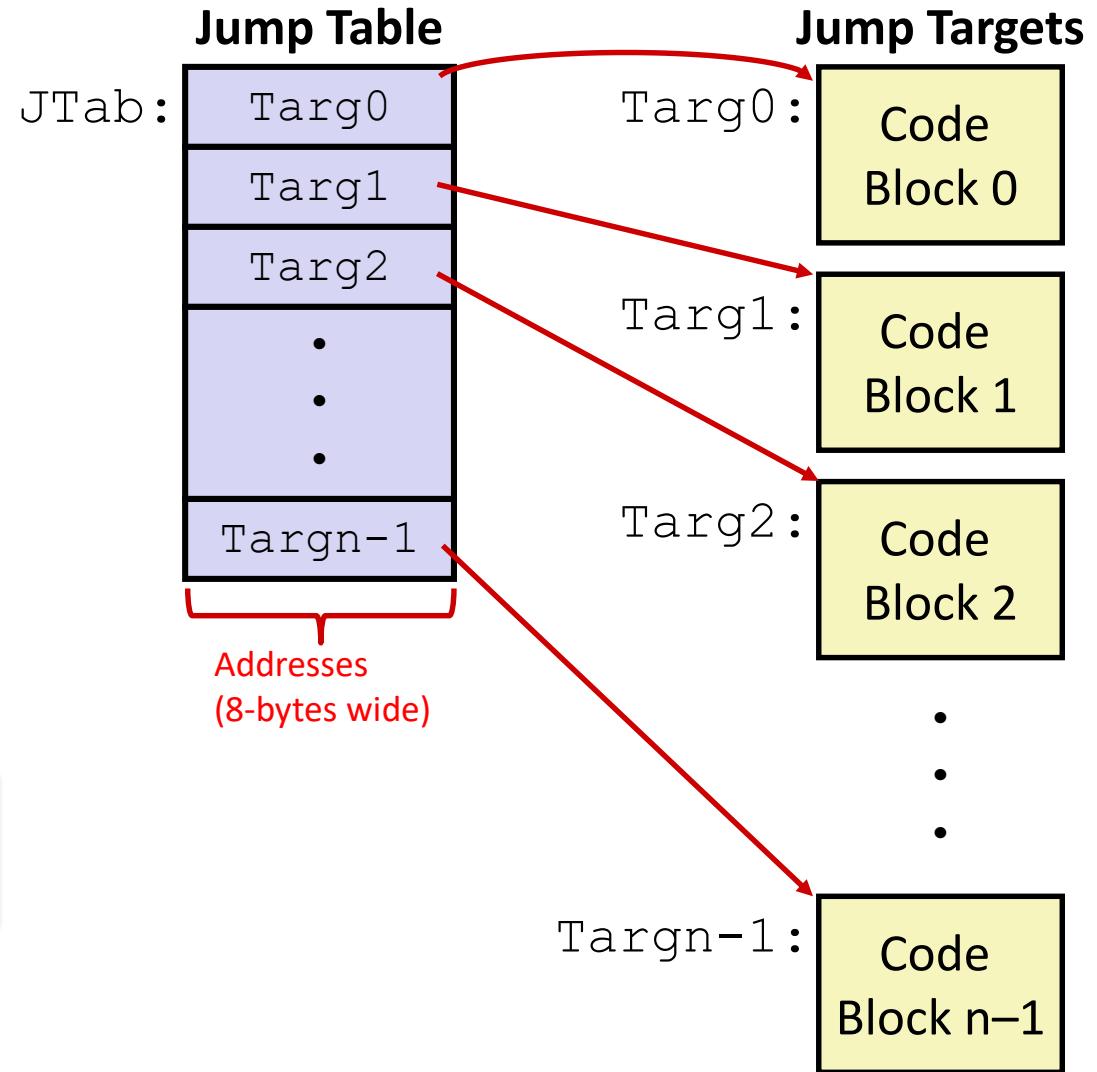

- ❖ Multiple case labels
 - Here: 5 & 6
- ❖ Fall through cases
 - Here: 2
- ❖ Missing cases
 - Here: 4

- ❖ Implemented with:
 - *Jump table*
 - *Indirect jump instruction*

Jump Table Structure

Switch Form

```
switch (x) {  
    case val_0:  
        Block 0  
    case val_1:  
        Block 1  
        . . .  
    case val_n-1:  
        Block n-1  
}
```

Approximate Translation

```
target = JTab[x];  
goto target;
```

Jump Table Structure

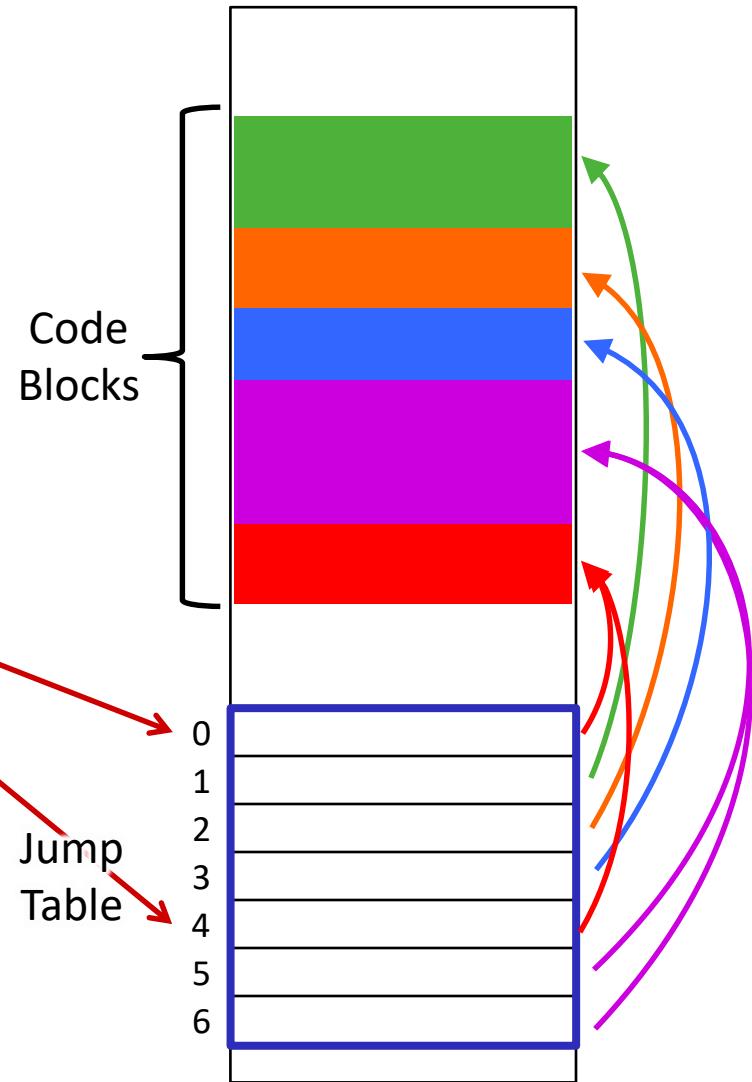

C code:

```
switch (x) {  
    case 1: <some code>  
        break;  
    case 2: <some code>  
    case 3: <some code>  
        break;  
    case 5:  
    case 6: <some code>  
        break;  
    default: <some code>  
}
```

Use the jump table when $x \leq 6$:

```
if (x <= 6)  
    target = JTab[x];  
    goto target;  
else  
    goto default;
```

Memory

Switch Statement Example

```
long switch_ex(long x, long y, long z)
{
    long w = 1;
    switch (x) {
        . . .
    }
    return w;
}
```

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rdx	3 rd argument (z)
%rax	Return value

Note compiler chose
to not initialize w

```
switch_eg:
    movq    %rdx, %rcx
    cmpq    $6, %rdi      # x:6
    ja     .L8          # default
    jmp    * .L4(, %rdi, 8) # jump table
```

Take a look!
<https://godbolt.org/g/DnOmXb>

jump above – unsigned > catches negative default cases

Switch Statement Example

```
long switch_ex(long x, long y, long z)
{
    long w = 1;
    switch (x) {
        . . .
    }
    return w;
}
```

Jump table

```
.section    .rodata
.align 8
.L4:
.quad      .L8    # x = 0
.quad      .L3    # x = 1
.quad      .L5    # x = 2
.quad      .L9    # x = 3
.quad      .L8    # x = 4
.quad      .L7    # x = 5
.quad      .L7    # x = 6
```

```
switch_eg:
    movq    %rdx, %rcx
    cmpq    $6, %rdi      # x:6
    ja     .L8            # default
    jmp    * .L4(, %rdi, 8) # jump table
```

Indirect
jump

Assembly Setup Explanation

❖ Table Structure

- Each target requires 8 bytes (address)
- Base address at .L4

❖ Direct jump: `jmp .L8`

- Jump target is denoted by label .L8

❖ Indirect jump: `jmp * .L4(, %rdi, 8)`

- Start of jump table: .L4
- Must scale by factor of 8 (addresses are 8 bytes)
- Fetch target from effective address .L4 + x*8
 - Only for $0 \leq x \leq 6$

Jump table

```
.section    .rodata
.align 8
.L4:
.quad     .L8    # x = 0
.quad     .L3    # x = 1
.quad     .L5    # x = 2
.quad     .L9    # x = 3
.quad     .L8    # x = 4
.quad     .L7    # x = 5
.quad     .L7    # x = 6
```

Jump Table

declaring data, not instructions

Jump table

```
.section .rodata  
.align 8
```

.L4:

```
.quad .L8 # x = 0  
.quad .L3 # x = 1  
.quad .L5 # x = 2  
.quad .L9 # x = 3  
.quad .L8 # x = 4  
.quad .L7 # x = 5  
.quad .L7 # x = 6
```

this data is 64-bits wide

8-byte memory alignment

```
switch(x) {  
    case 1:      // .L3  
        w = y*z;  
        break;  
    case 2:      // .L5  
        w = y/z;  
        /* Fall Through */  
    case 3:      // .L9  
        w += z;  
        break;  
    case 5:  
    case 6:      // .L7  
        w -= z;  
        break;  
    default:     // .L8  
        w = 2;  
}
```

Code Blocks ($x == 1$)

```
switch(x) {  
    case 1:      // .L3  
        w = y*z;  
        break;  
        . . .  
}
```

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rdx	3 rd argument (z)
%rax	Return value

```
.L3:  
    movq    %rsi, %rax    # y  
    imulq   %rdx, %rax    # y*z  
    ret
```

Handling Fall-Through

```
long w = 1;  
.  
.  
switch (x) {  
    .  
    .  
    .  
case 2: // .L5  
    w = y/z;  
    /* Fall Through */  
case 3: // .L9  
    w += z;  
break;  
.  
.  
}
```

case 2:

```
w = y/z;  
goto merge;
```

*More complicated choice than
“just fall-through” forced by
“migration” of w = 1;*

- *Example compilation trade-off*

case 3:

```
w = 1;
```

merge:

```
w += z;
```

Code Blocks ($x == 2$, $x == 3$)

```

long w = 1;
. . .
switch (x) {
    . . .
    case 2: // .L5
        w = y/z;
    /* Fall Through */
    case 3: // .L9
        w += z;
    break;
. . .
}

```

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rdx	3 rd argument (z)
%rax	Return value

```

.L5:                                # Case 2:
    movq    %rsi, %rax   # y in rax
    cqto          # Div prep
    idivq   %rcx       # y/z
    jmp     .L6         # goto merge
.L9:                                # Case 3:
    movl    $1, %eax   # w = 1
.L6:                                # merge:
    addq    %rcx, %rax # w += z
    ret

```

Code Blocks (rest)

```
switch (x) {  
    . . .  
    case 5: // .L7  
    case 6: // .L7  
        w -= z;  
        break;  
    default: // .L8  
        w = 2;  
}
```

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rdx	3 rd argument (z)
%rax	Return value

```
.L7:                      # Case 5, 6:  
    movl $1, %eax      # w = 1  
    subq %rdx, %rax   # w -= z  
    ret  
.L8:                      # Default:  
    movl $2, %eax      # 2  
    ret
```

Roadmap

C:

```
car *c = malloc(sizeof(car));
c->miles = 100;
c->gals = 17;
float mpg = get_mpg(c);
free(c);
```

Java:

```
Car c = new Car();
c.setMiles(100);
c.setGals(17);
float mpg =
    c.getMPG();
```

Assembly language:

```
get_mpg:
    pushq   %rbp
    movq    %rsp, %rbp
    ...
    popq    %rbp
    ret
```

Machine code:

```
0111010000011000
1000110100000100000000010
1000100111000010
110000011111101000011111
```

Computer system:

OS:

Memory & data
Integers & floats
x86 assembly
Procedures & stacks
Executables
Arrays & structs
Memory & caches
Processes
Virtual memory
Memory allocation
Java vs. C

Mechanisms required for *procedures*

1) Passing control

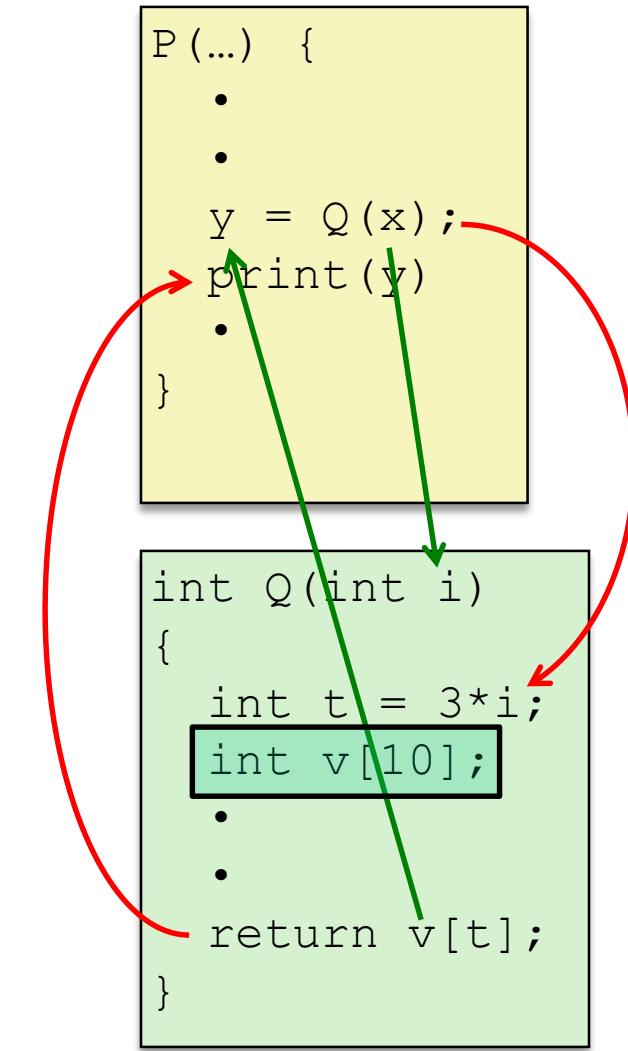

- To beginning of procedure code
- Back to return point

2) Passing data

- Procedure arguments
- Return value

3) Memory management

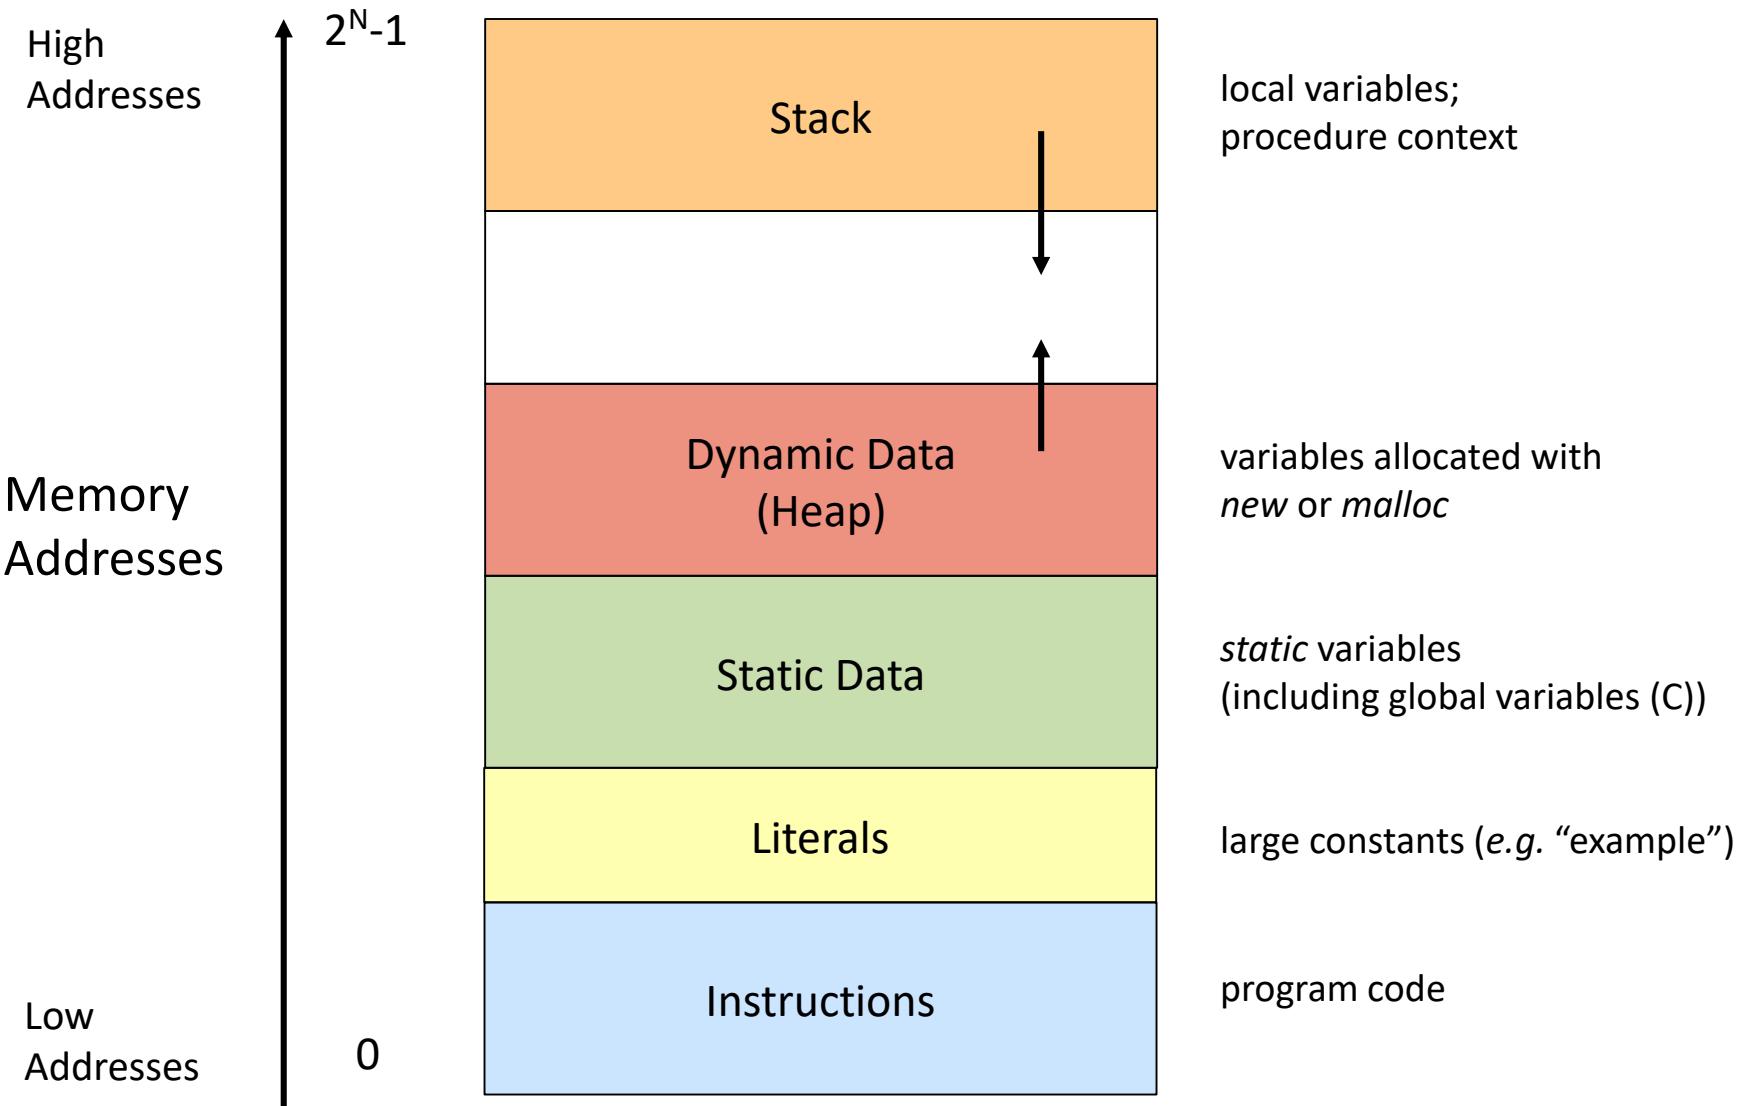

- Allocate during procedure execution
- Deallocate upon return
- ❖ All implemented with machine instructions!
 - An x86-64 procedure uses only those mechanisms required for that procedure

Procedures

- ❖ **Stack Structure**
- ❖ Calling Conventions
 - Passing control
 - Passing data
 - Managing local data
- ❖ Register Saving Conventions
- ❖ Illustration of Recursion

Simplified Memory Layout

segmentation faults?

Memory Permissions

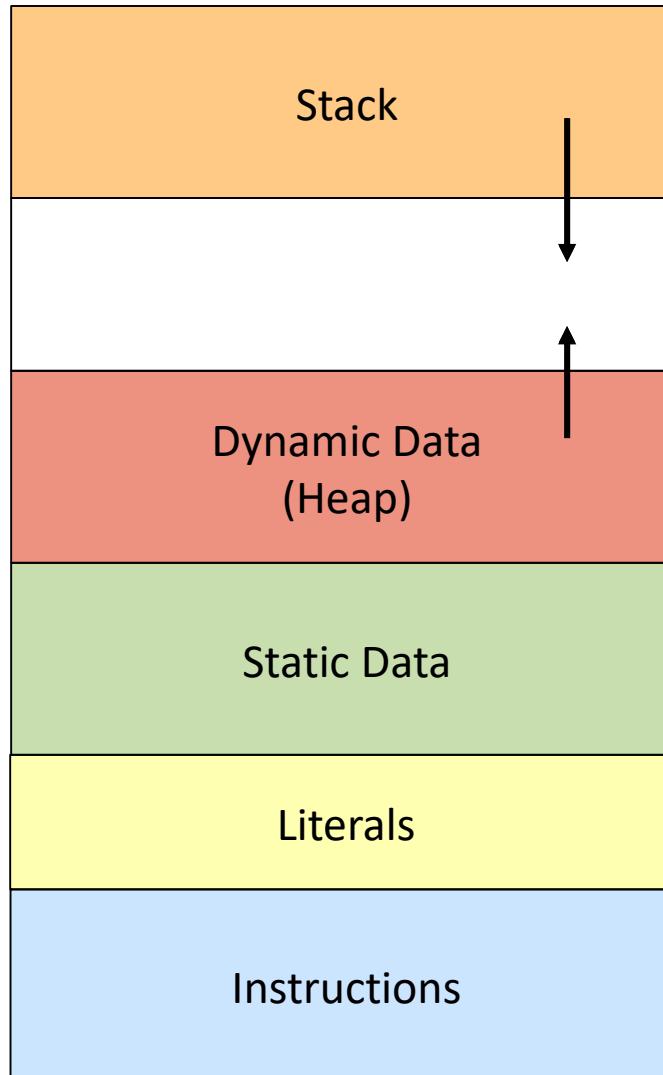

writable; not executable

writable; not executable

writable; not executable

read-only; not executable

read-only; executable

Managed “automatically”
(by compiler)

Managed by programmer

Initialized when process starts

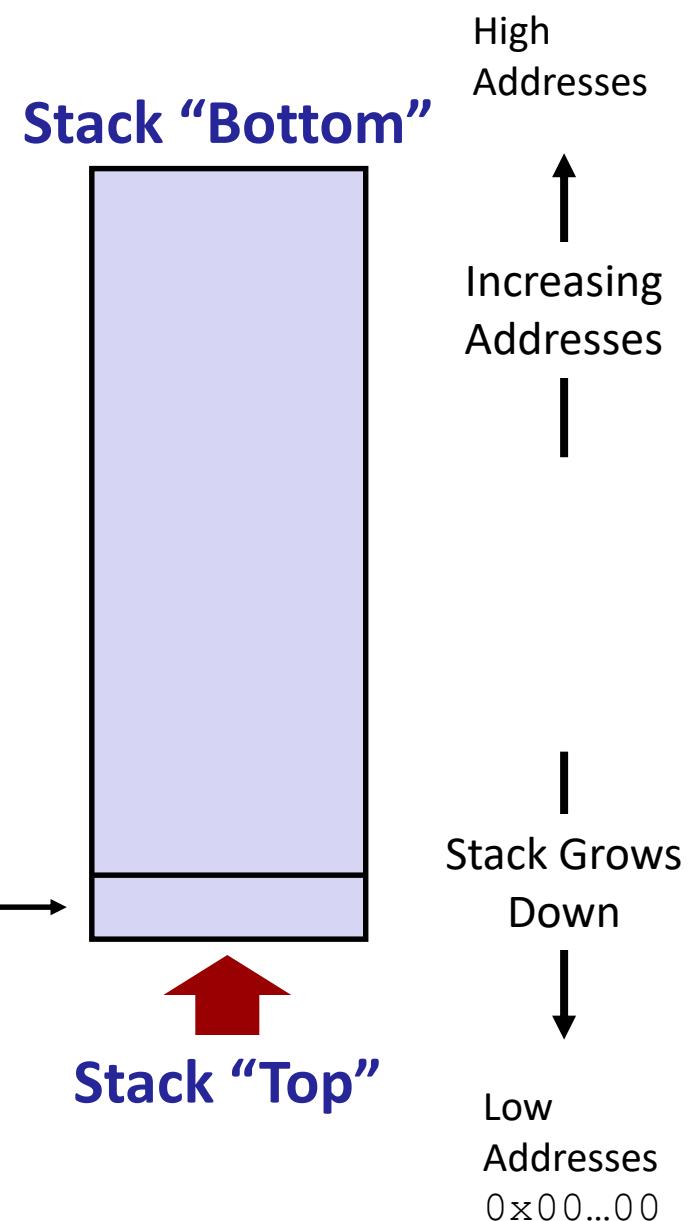

Initialized when process starts

Initialized when process starts

x86-64 Stack

- ❖ Region of memory managed with stack “discipline”
 - Grows toward lower addresses
 - Customarily shown “upside-down”
- ❖ Register `%rsp` contains *lowest* stack address
 - `%rsp` = address of *top* element, the most-recently-pushed item that is not-yet-popped

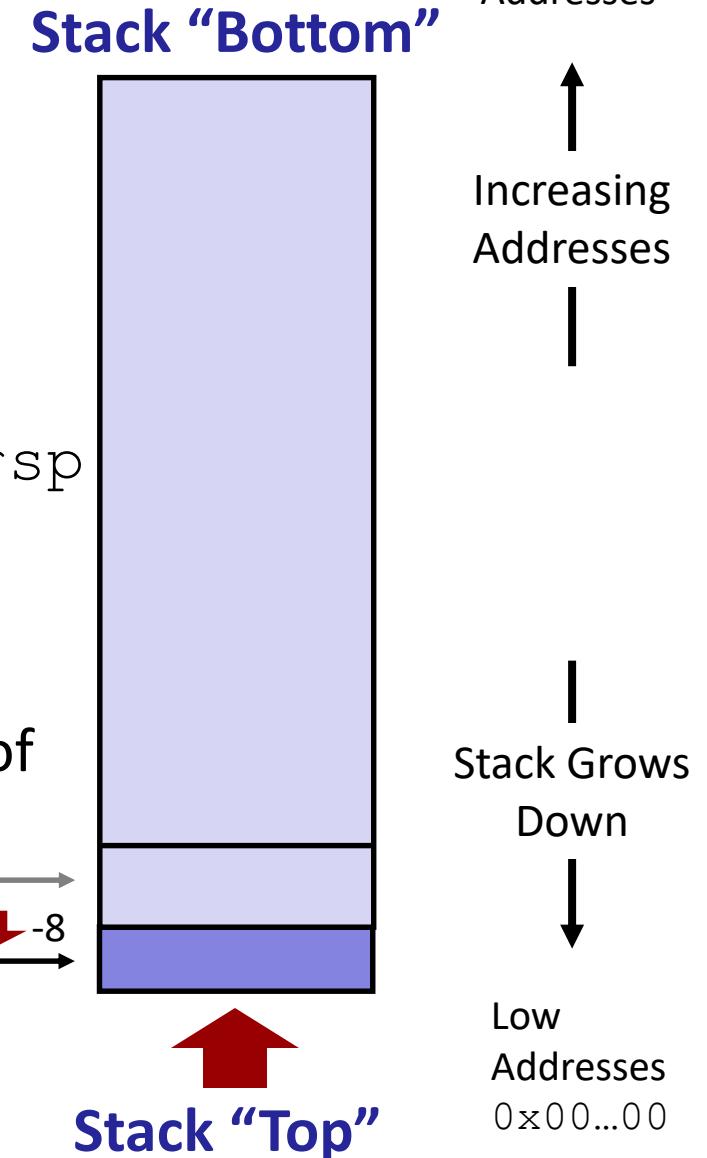

Stack Pointer: `%rsp` →

x86-64 Stack: Push

- ❖ `pushq src`
 - Fetch operand at *src*
 - *Src* can be reg, memory, immediate
 - **Decrement** $\%rsp$ by 8
 - Store value at address given by $\%rsp$
- ❖ Example:
 - `pushq %rcx`
 - Adjust $\%rsp$ and store contents of $\%rcx$ on the stack

Stack Pointer: $\%rsp$

x86-64 Stack: Pop

- ❖ `popq dst`
 - Load value at address given by `%rsp`
 - Store value at *dst* (must be register)
 - **Increment** `%rsp` by 8
- ❖ Example:
 - `popq %rcx`
 - Stores contents of top of stack into `%rcx` and adjust `%rsp`
