Floating Point II

CSE 351 Autumn 2019

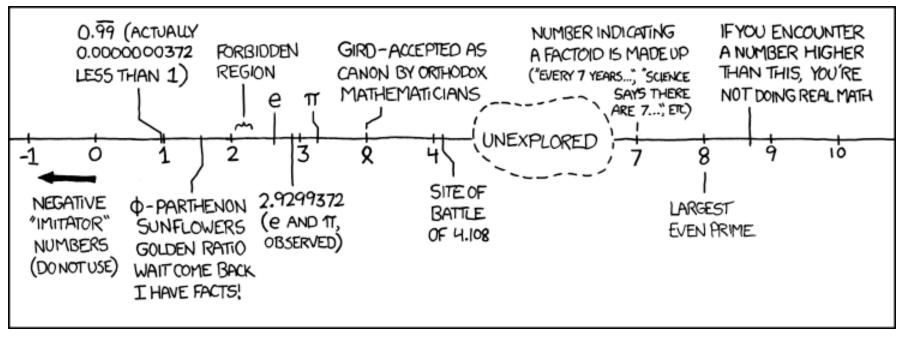

Instructor: Teaching Assistants:

Justin Hsia Andrew Hu Antonio Castelli Cosmo Wang

Diya Joy Ivy Yu Kaelin Laundry

Maurice Montag Melissa Birchfield Millicent Li

Suraj Jagadeesh

Administrivia

- hw6 due Friday, hw7 due Monday
- Lab 1a grades hopefully released by end of Sunday (10/13)
- Lab 1b due Monday (10/14)
 - Submit bits.c and lab1Breflect.txt
- Section tomorrow on Integers and Floating Point

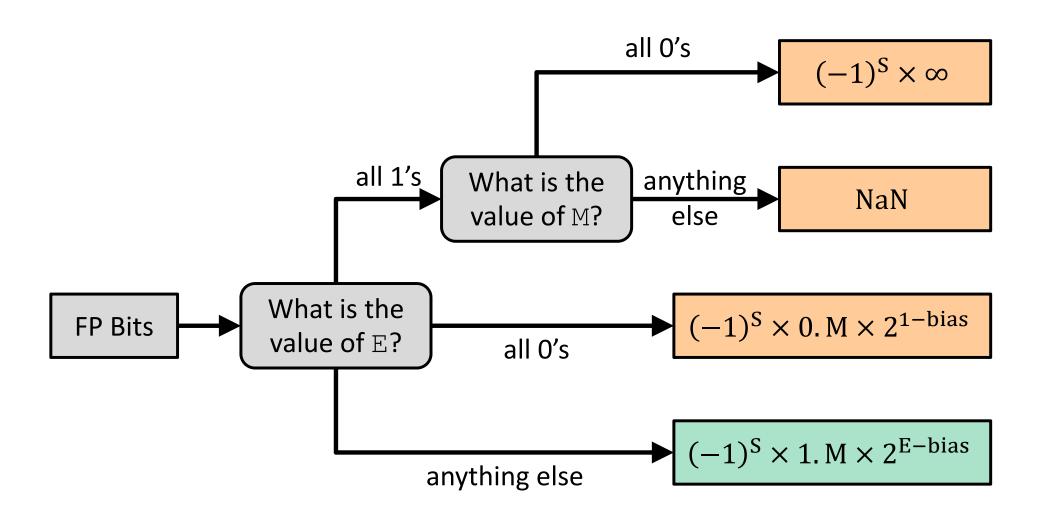

Other Special Cases

- \star E = 0xFF, M = 0: $\pm \infty$
 - *e.g.* division by 0
 - Still work in comparisons!
- \star E = 0xFF, M \neq 0: Not a Number (NaN)
 - e.g. square root of negative number, 0/0, $\infty-\infty$
 - NaN propagates through computations
 - Value of M can be useful in debugging
- New largest value (besides ∞)?
 - E = 0xFF has now been taken!
 - **E** = 0xFE has largest: $1.1...1_2 \times 2^{127} = 2^{128} 2^{104}$

Floating Point Encoding Summary

E	M	Meaning
0x00	0	± 0
0x00	non-zero	± denorm num
0x01 – 0xFE	anything	± norm num
0xFF	0	± ∞
OxFF	non-zero	NaN

Floating Point Interpretation Flow Chart

Floating point topics

- Fractional binary numbers
- IEEE floating-point standard
- Floating-point operations and rounding
- Floating-point in C

- There are many more details that we won't cover
 - It's a 58-page standard...

Tiny Floating Point Representation

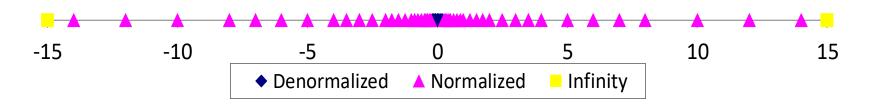

• We will use the following 8-bit floating point representation to illustrate some key points:

- Assume that it has the same properties as IEEE floating point:
 - bias =
 - encoding of -0 =
 - encoding of $+\infty$ =
 - encoding of the largest (+) normalized # =
 - encoding of the smallest (+) normalized # =

Distribution of Values

- What ranges are NOT representable?
 - Between largest norm and infinity Overflow (Exp too large)
 - Between zero and smallest denorm Underflow (Exp too small)
 - Between norm numbers? Rounding
- Given a FP number, what's the bit pattern of the next largest representable number?
 - What is this "step" when Exp = 0?
 - What is this "step" when Exp = 100?
- Distribution of values is denser toward zero

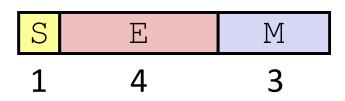

Floating Point Rounding

- The IEEE 754 standard actually specifies different rounding modes:
 - Round to nearest, ties to nearest even digit
 - Round toward $+\infty$ (round up)
 - Round toward —∞ (round down)
 - Round toward 0 (truncation)
- In our tiny example:
 - Man = 1.001 01 rounded to M = 0b001
 - Man = 1.001 11 rounded to M = 0b010
 - Man = 1.001 10 rounded to M = 0b010

Floating Point Operations: Basic Idea

Value = $(-1)^{s}$ ×Mantissa×2^{Exponent}

$$\star x +_f y = Round(x + y)$$

$$\star x \star_f y = Round(x \star y)$$

- Basic idea for floating point operations:
 - First, compute the exact result
 - Then round the result to make it fit into the specified precision (width of M)
 - Possibly over/underflow if exponent outside of range

Mathematical Properties of FP Operations

- * Overflow yields $\pm \infty$ and underflow yields 0
- ◆ Floats with value ±∞ and NaN can be used in operations
 - Result usually still $\pm \infty$ or NaN, but not always intuitive
- Floating point operations do not work like real math, due to rounding

 - Not distributive: 100*(0.1+0.2) != 100*0.1+100*0.2
 30.00000000000003553 30
 - Not cumulative
 - Repeatedly adding a very small number to a large one may do nothing

Limits of Interest

This is extra (non-testable) material

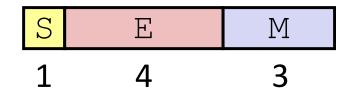

- The following thresholds will help give you a sense of when certain outcomes come into play, but don't worry about the specifics:
 - **FOver** = $2^{bias+1} = 2^8$
 - This is just larger than the largest representable normalized number
 - **FDenorm** = $2^{1-\text{bias}} = 2^{-6}$
 - This is the smallest representable normalized number
 - **FUnder** = $2^{1-\text{bias}-m} = 2^{-9}$
 - m is the width of the mantissa field
 - This is the smallest representable denormalized number

Floating Point Encoding Flow Chart

Example Question

❖ Using our 8-bit representation, what value gets stored when we try to encode 384 = 2⁸ + 2⁷?

No voting

A. + 256

B. + 384

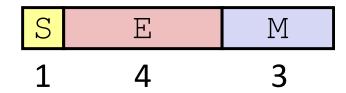

C. + ∞

D. NaN

E. We're lost...

Polling Question

* Using our **8-bit** representation, what value gets stored when we try to encode **2.625** = $2^1 + 2^{-1} + 2^{-3}$?

Vote at http://PollEv.com/justinh

A. +2.5

B. + 2.625

C. + 2.75

D. + 3.25

E. We're lost...

Floating point topics

- Fractional binary numbers
- IEEE floating-point standard
- Floating-point operations and rounding
- Floating-point in C

- There are many more details that we won't cover
 - It's a 58-page standard...

Floating Point in C

Two common levels of precision:

float	1.0f	single precision (32-bit)
double	1.0	double precision (64-bit)

- #include <math.h> to get INFINITY and NAN
 constants
- Equality (==) comparisons between floating point numbers are tricky, and often return unexpected results, so just avoid them!

Floating Point Conversions in C

- Casting between int, float, and double changes the bit representation
 - int → float
 - May be rounded (not enough bits in mantissa: 23)
 - Overflow impossible
 - int or float → double
 - Exact conversion (all 32-bit ints representable)
 - long → double
 - Depends on word size (32-bit is exact, 64-bit may be rounded)
 - double or float → int
 - Truncates fractional part (rounded toward zero)
 - "Not defined" when out of range or NaN: generally sets to Tmin (even if the value is a very big positive)

Polling Question

- ❖ We execute the following code in C. How many bytes are the same (value and position) between i and f?
 - Vote at http://PollEv.com/justinh

```
int i = 384;  // 2^8 + 2^7
float f = (float) i;
```

- A. 0 bytes
- B. 1 byte
- C. 2 bytes
- D. 3 bytes
- E. We're lost...

Floating Point and the Programmer

```
#include <stdio.h>
                                      $ ./a.out
int main(int argc, char* argv[]) {
                                      0x3f800000 0x3f800001
  float f1 = 1.0;
                                      f1 = 1.000000000
  float f2 = 0.0;
                                      f2 = 1.000000119
  int i;
  for (i = 0; i < 10; i++)
                                      f1 == f3? yes
   f2 += 1.0/10.0:
 printf("0x%08x 0x%08x\n", *(int*)&f1, *(int*)&f2);
 printf("f1 = %10.9f\n", f1);
 printf("f2 = %10.9f\n\n", f2);
  f1 = 1E30;
  f2 = 1E-30;
  float f3 = f1 + f2;
 printf("f1 == f3? sn'', f1 == f3 ? "yes" : "no" );
 return 0;
```

Floating Point Summary

- Floats also suffer from the fixed number of bits available to represent them
 - Can get overflow/underflow
 - "Gaps" produced in representable numbers means we can lose precision, unlike ints
 - Some "simple fractions" have no exact representation (e.g. 0.2)
 - "Every operation gets a slightly wrong result"
- Floating point arithmetic not associative or distributive
 - Mathematically equivalent ways of writing an expression may compute different results
- Never test floating point values for equality!
- Careful when converting between ints and floats!

Number Representation Really Matters

- 1991: Patriot missile targeting error
 - clock skew due to conversion from integer to floating point
- 1996: Ariane 5 rocket exploded (\$1 billion)
 - overflow converting 64-bit floating point to 16-bit integer
- 2000: Y2K problem
 - limited (decimal) representation: overflow, wrap-around
- 2038: Unix epoch rollover
 - Unix epoch = seconds since 12am, January 1, 1970
 - signed 32-bit integer representation rolls over to TMin in 2038

Other related bugs:

- 1982: Vancouver Stock Exchange 10% error in less than 2 years
- 1994: Intel Pentium FDIV (floating point division) HW bug (\$475 million)
- 1997: USS Yorktown "smart" warship stranded: divide by zero
- 1998: Mars Climate Orbiter crashed: unit mismatch (\$193 million)

Summary

E	M	Meaning
0x00	0	± 0
0x00	non-zero	± denorm num
0x01 – 0xFE	anything	± norm num
0xFF	0	± ∞
0xFF	non-zero	NaN

- Floating point encoding has many limitations
 - Overflow, underflow, rounding
 - Rounding is a HUGE issue due to limited mantissa bits and gaps that are scaled by the value of the exponent
 - Floating point arithmetic is NOT associative or distributive
- Converting between integral and floating point data types does change the bits
