Administrivia

- ❖ Lab 0 due Monday @ 11:59 pm
 - *You will be revisiting this program throughout this class!*
- ❖ Homework 1 due Wednesday
 - Reminder: autograded, 20 tries, no late submissions
- ❖ Lab 1a released Monday, due next Monday (4/15)
 - Pointers in C
 - Reminder: last submission graded, *individual* work

Lab Late Days

- ❖ All submissions due at 11:59 pm
 - Count lateness in *days* (**even if just by a second**)
 - Special: weekends count as *one day*
 - No submissions accepted more than two “late days” late
- ❖ You are given **5 lab late days** for the whole quarter
 - Late days only apply to Labs (not HW)
 - No benefit to having leftover late days
 - If you use more than 5 late days, late penalty is 20% deduction per day
 - Penalties applied at end of quarter to *maximize* your grade
- ❖ Use at own risk – don’t want to fall too far behind
 - Intended to allow for unexpected circumstances

Review Questions

- 1) If the word size of a machine is 64-bits, which of the following is usually true? (pick all that apply)
 - a) 64 bits is the size of a pointer T
 - b) 64 bits is the size of an integer F
 - c) 64 bits is the width of a register T
- 2) (True/False) By looking at the bits stored in memory, I can tell if a particular 4-bytes is being used to represent an integer, floating point number, or instruction.
- 3) If the size of a pointer on a machine is 6 bits, the address space is how many bytes? 2 2 2 2 2
 2^6

Memory, Data, and Addressing

- ❖ Hardware - High Level Overview
- ❖ Representing information as bits and bytes
 - Memory is a byte-addressable array
 - Machine “word” size = address size = register size
- ❖ Organizing and addressing data in memory
 - Endianness – ordering bytes in memory
- ❖ **Manipulating data in memory using C**
- ❖ Boolean algebra and bit-level manipulations

Addresses and Pointers in C

- ❖ `&` = “address of” operator
- ❖ `*` = “value at address” or “dereference” operator

datatype
 equivalent
`{ int *ptr;`
`int *ptr;`

Declares a variable, `ptr`, that is a pointer to (i.e. holds the address of) an `int` in memory

`int x = 5;`
`int y = 2;`

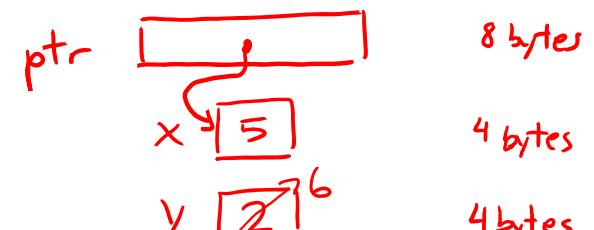

Declares two variables, `x` and `y`, that hold `ints`, and initializes them to 5 and 2, respectively

`ptr = &x;`

Sets `ptr` to the address of `x` (“`ptr` points to `x`”)

`y = 1 + *ptr;`

“Dereference `ptr`”

Sets `y` to “1 plus the value stored at the address held by `ptr`. Because `ptr` points to `x`, this is equivalent to `y=1+x`;

What is `*(&y)` ?

↳ returns value stored in `y` (equivalent to just using `y`)

Assignment in C

- ❖ A variable is represented by a location in memory
- ❖ Declaration ≠ initialization (initially holds “garbage”)
- ❖ **int x, y;**

- x is at address 0x04, y is at 0x18

The diagram illustrates the current state of memory for the variables x and y. The memory is organized into a grid where rows represent memory addresses (0x00 to 0x24) and columns represent byte values (0x00 to 0x03). Red arrows point from the text labels 'x' and 'y' to their respective memory locations at addresses 0x04 and 0x18.

	0x00	0x01	0x02	0x03
0x00	A7	00	32	00
0x04	00	01	29	F3
0x08	EE	EE	EE	EE
0x0C	FA	CE	CA	FE
0x10	26	00	00	00
0x14	00	00	10	00
0x18	01	00	00	00
0x1C	FF	00	F4	96
0x20	DE	AD	BE	EF
0x24	00	00	00	00

Current state
of memory

Assignment in C

32-bit example
(pointers are 32-bits wide)

little-endian

- ❖ A variable is represented by a location in memory
- ❖ Declaration ≠ initialization (initially holds “garbage”)
- ❖ **int x, y;**
 - x is at address 0x04, y is at 0x18

	0x00	0x01	0x02	0x03
0x00				
0x04	00	01	29	F3
0x08				
0x0C				
0x10				
0x14				
0x18	01	00	00	00
0x1C				
0x20				
0x24				

X

Y

Assignment in C

- ❖ left-hand side = right-hand side;
 - LHS must evaluate to a *location*
 - RHS must evaluate to a *value* (could be an address)
 - Store RHS value at LHS location
- ❖ **int** `x, y;`
- ❖ `x = 0;` *int (4 bytes)*
pad *0x00 00 00 00*

32-bit example
(pointers are 32-bits wide)

`&` = “address of”

`*` = “dereference”

	0x00	0x01	0x02	0x03	
0x00					
0x04	00	00	00	00	X
0x08					
0x0C					
0x10					
0x14					
0x18	01	00	00	00	Y
0x1C					
0x20					
0x24					

Assignment in C

- ❖ left-hand side = right-hand side;
 - LHS must evaluate to a *location*
 - RHS must evaluate to a *value* (could be an address)
 - Store RHS value at LHS location
- ❖ **int** x, y;
- ❖ x = 0;
- ❖ y = 0x3CD02700;

least significant byte

little endian!

32-bit example
(pointers are 32-bits wide)

& = “address of”

* = “dereference”

	0x00	0x01	0x02	0x03
0x00				
0x04	00	00	00	00
0x08				
0x0C				
0x10				
0x14				
0x18	00	27	D0	3C
0x1C				
0x20				
0x24				

X

Y

Assignment in C

- ❖ left-hand side = right-hand side;
 - LHS must evaluate to a *location*
 - RHS must evaluate to a *value* (could be an address)
 - Store RHS value at LHS location
- ❖ **int** x, y;
- ❖ x = 0;
- ❖ y = 0x3CD02700;
- ❖ x = y + 3;
- Get value at y, add 3, store in x

32-bit example
(pointers are 32-bits wide)

& = “address of”

* = “dereference”

	0x00	0x01	0x02	0x03	
0x00					
0x04	03	27	D0	3C	x
0x08					
0x0C					
0x10					
0x14					
0x18	00	27	D0	3C	y
0x1C					
0x20					
0x24					

Assignment in C

- ❖ left-hand side = right-hand side;
 - LHS must evaluate to a *location*
 - RHS must evaluate to a *value* (could be an address)
 - Store RHS value at LHS location
- ❖ **int** x, y;
- ❖ x = 0;
- ❖ y = 0x3CD02700;
- ❖ x = y + 3;
 - Get value at y, add 3, store in x
- ❖ **int*** z;
 - z is at address 0x20
 - pointer to an int*

32-bit example
(pointers are 32-bits wide)

& = “address of”

* = “dereference”

	0x00	0x01	0x02	0x03	
0x00					
0x04	03	27	D0	3C	X
0x08					
0x0C					
0x10					
0x14					
0x18	00	27	D0	3C	Y
0x1C					
0x20	DE	AD	BE	EF	Z
0x24					

initial value is whatever bits
were already there! (“garbage”)

Assignment in C

- ❖ left-hand side = right-hand side;
 - LHS must evaluate to a *location*
 - RHS must evaluate to a *value* (could be an address)
 - Store RHS value at LHS location
- ❖ **int** x, y;
- ❖ x = 0;
- ❖ y = 0x3CD02700;
- ❖ x = y + 3;
 - Get value at y, add 3, store in x
- ❖ **int*** z = ^{0x18} &y + 3; // expect 0x1b
 - Get address of y, “add 3”, store in z

32-bit example
(pointers are 32-bits wide)

& = “address of”

* = “dereference”

	0x00	0x01	0x02	0x03	
0x00					x
0x04	03	27	D0	3C	
0x08					
0x0C					
0x10					
0x14					
0x18	00	27	D0	3C	y
0x1C					
0x20	24	00	00	00	z
0x24					

get this instead

Pointer arithmetic

Pointer Arithmetic

- ❖ Pointer arithmetic is scaled by the size of target type
 - In this example, `sizeof(int) = 4`
- ❖ `int* z = &y + 3;`
 - Get address of `y`, add `3 * sizeof(int)`, store in `z`
 - $\&y = 0x18 = 1 \cdot 16^1 + 8 \cdot 16^0 = 24$
 - $24 + 3 \cdot (4) = 36 = 2 \cdot 16^1 + 4 \cdot 16^0 = \underline{\underline{0x24}}$
- ❖ Pointer arithmetic can be dangerous!
 - Can easily lead to bad memory accesses
 - Be careful with data types and *casting*

Assignment in C

- ❖ **int** x, y;
- ❖ x = 0;
- ❖ y = 0x3CD02700;
- ❖ x = y + 3;
 - Get value at y, add 3, store in x
- ❖ **int*** z = &y + 3;
 - Get address of y, add 12, store in z
- ❖ *z = y;
 - What does this do?

32-bit example
(pointers are 32-bits wide)

& = “address of”

* = “dereference”

	0x00	0x01	0x02	0x03	
0x00					
0x04	03	27	D0	3C	X
0x08					
0x0C					
0x10					
0x14					
0x18	00	27	D0	3C	Y
0x1C					
0x20	24	00	00	00	Z
0x24					

Assignment in C

- ❖ **int** x, y;
- ❖ x = 0;
- ❖ y = 0x3CD02700;
- ❖ x = y + 3;
 - Get value at y, add 3, store in x
- ❖ **int*** z = &y + 3;
 - Get address of y, add 12, store in z

The target of a pointer
is also a location
- ❖ ~~*z = y;~~
 - Get value of y, put in address stored in z

32-bit example
(pointers are 32-bits wide)

& = “address of”

* = “dereference”

	0x00	0x01	0x02	0x03
0x00				
0x04	03	27	D0	3C
0x08				
0x0C				
0x10				
0x14				
0x18	00	27	D0	3C
0x1C				
0x20	24	00	00	00
0x24	00	27	D0	3C

X Y Z

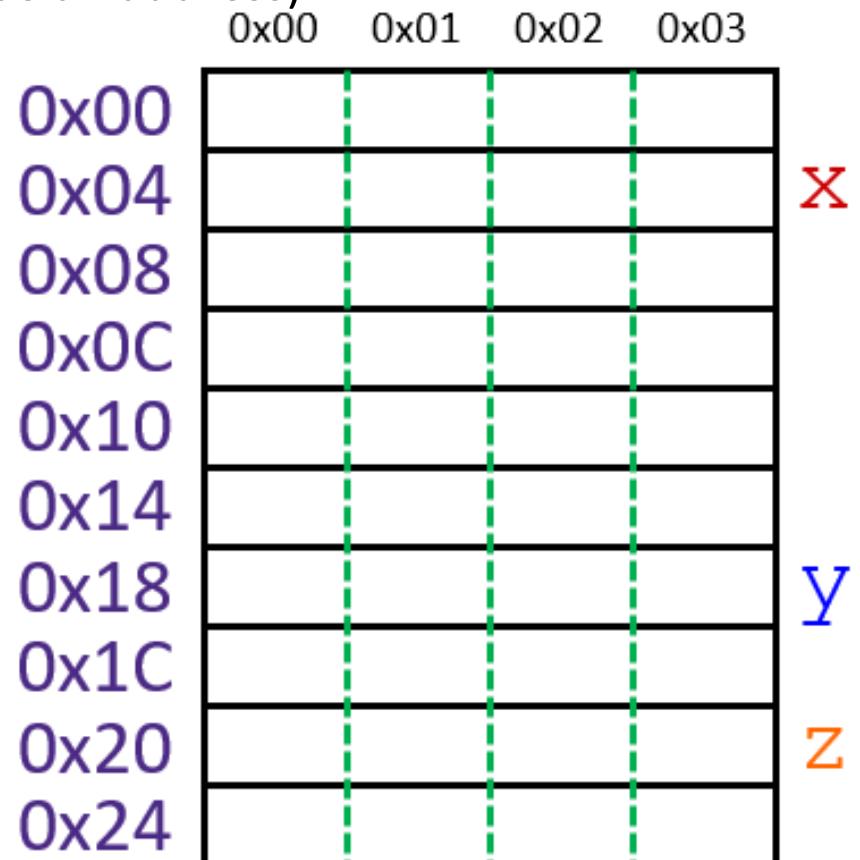

Assignment in C - Handout

- ❖ left-hand side = right-hand side;
 - LHS must evaluate to a *location*
 - RHS must evaluate to a *value* (could be an address)
 - Store RHS value at LHS location
- ❖ **int** x, y;
- ❖ x = 0;
- ❖ y = 0x3CD02700;
- ❖ x = y + 3;
 - Get value at y, add 3, store in x
- ❖ **int*** z = &y + 3;
 - Get address of y, add 12, store in z
- ❖ *z = y;
 - Get value of y, put in address stored in z

32-bit example
(pointers are 32-bits wide)

& = “address of”

* = “dereference”

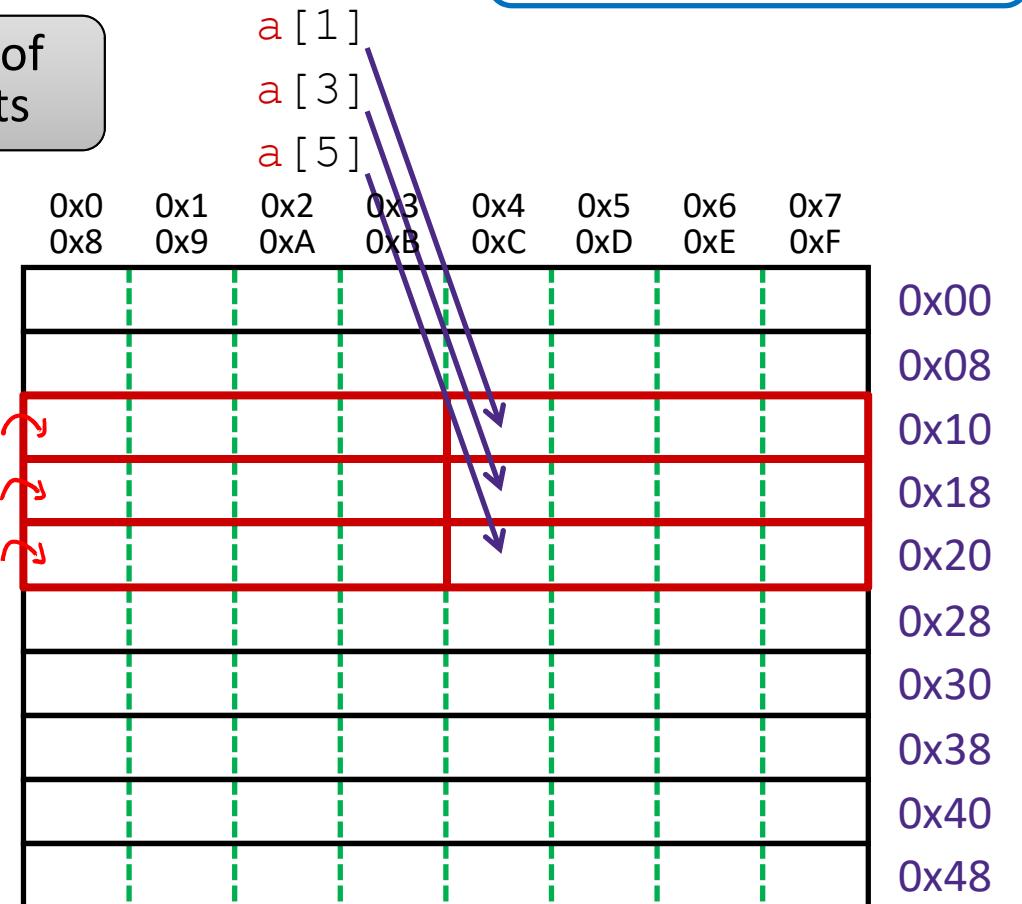

Arrays in C

Declaration: `int a[6];` // &a is 0x10

element type

name

number of elements

Arrays in C

Declaration: **int** **a** [6] ;

Indexing: **a** [0] = 0x015f;
 a [5] = **a** [0];

Arrays are adjacent locations in memory
storing the same type of data object

a (array name) returns the array's address

&a [i] is the address of **a** [0] plus i times
the element size in bytes

0x0 0x8	0x1 0x9	0x2 0xA	0x3 0xB	0x4 0xC	0x5 0xD	0x6 0xE	0x7 0xF	0x00
								0x08
								0x10
a [0]	5F	01	00	00				0x18
a [2]								0x20
a [4]				5F	01	00	00	0x28
								0x30
								0x38
								0x40
								0x48

Arrays in C

Declaration: `int a[6];`

Indexing: `a[0] = 0x015f;`
`a[5] = a[0];`

No bounds
checking: `a[6] = 0xBAD;`
`a[-1] = 0xBAD;`

Arrays are adjacent locations in memory
storing the same type of data object

`a` (array name) returns the array's address

`&a[i]` is the address of `a[0]` plus i times
the element size in bytes

	0x0	0x1	0x2	0x3	0x4	0x5	0x6	0x7	
	0x0	0x8	0x9	0xA	0xB	0xC	0xD	0xE	0xF
a[0]	5F	01	00	00					0x00
a[2]									0x08
a[4]					5F	01	00	00	0x10
"a[6]"	AD	0B	00	00					0x18
									0x20
									0x28
									0x30
									0x38
									0x40
									0x48

Arrays in C

Declaration: `int a[6];`

Indexing: `a[0] = 0x015f;`
`a[5] = a[0];`

No bounds
checking: `a[6] = 0xBAD;`
`a[-1] = 0xBAD;`

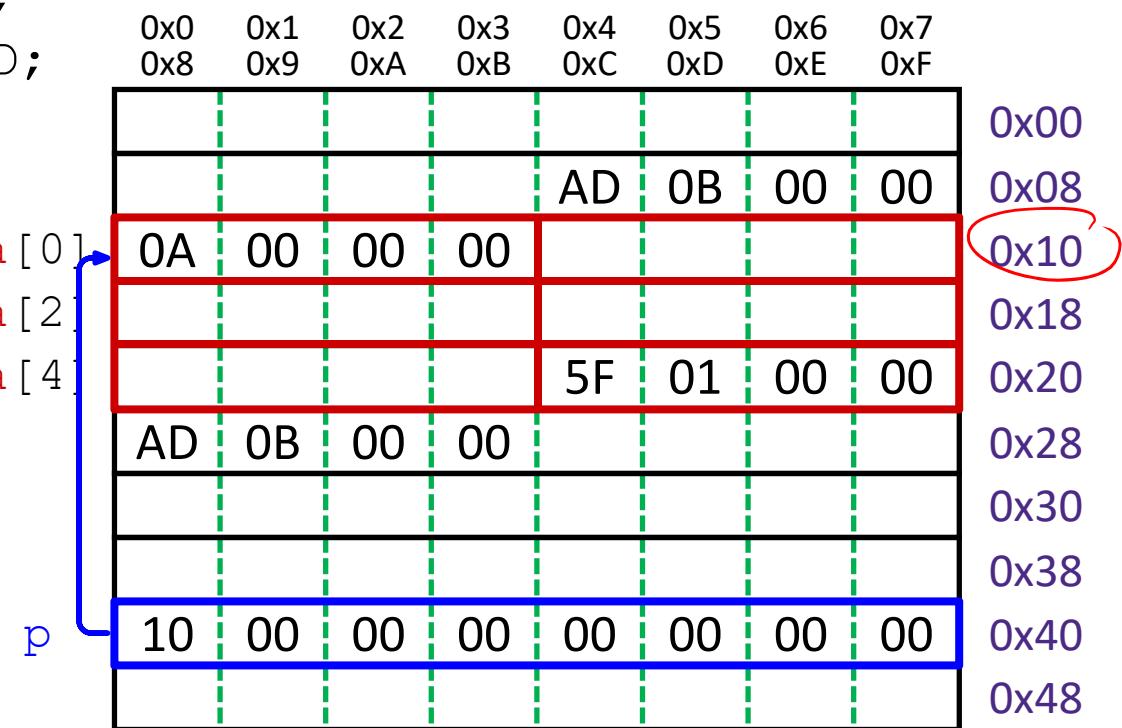

Pointers: `int* p;`

equivalent
`p = a;`
`p = &a[0];`
`*p = 0xA;`

Arrays are adjacent locations in memory
storing the same type of data object

`a` (array name) returns the array's address

`&a[i]` is the address of `a[0]` plus `i` times
the element size in bytes

Arrays in C

Declaration: `int a[6];`

Indexing: `a[0] = 0x015f;`
`a[5] = a[0];`

No bounds checking: `a[6] = 0xBAD;`
`a[-1] = 0xBAD;`

Pointers: `int* p;`
 equivalent `[p = a;`
`p = &a[0];`
`*p = 0xA;`

array indexing = address arithmetic
 (both scaled by the size of the type)

equivalent `[p[1] = 0xB;`
`* (p+1) = 0xB;`
 pointer arithmetic: `0x10 + 1 → 6x14`
`p = p + 2;`

$0x10 + 2 \rightarrow 0x18$

Arrays are adjacent locations in memory storing the same type of data object

`a` (array name) returns the array's address

`&a[i]` is the address of `a[0]` plus i times the element size in bytes

$$p[i] \iff *(p + i)$$

0x0	0x1	0x2	0x3	0x4	0x5	0x6	0x7	0x8	0x9	0xA	0xB	0xC	0xD	0xE	0xF	0x00	0x08	0x10	0x18	0x20	0x28	0x30	0x38	0x40	0x48			
<code>a[0]</code>								<code>0A 00 00 00</code>	<code>0B 00 00 00</code>		<code>AD 0B 00 00</code>	<code>5F 01 00 00</code>																
<code>a[2]</code>																												
<code>a[4]</code>																												
<code>p</code>								<code>10 00 00 00</code>	<code>00 00 00 00</code>																			

$$a + 2 * \text{sizeof}(\text{int}) = 0x18$$

Arrays in C

Declaration: `int a[6];`

Indexing: `a[0] = 0x015f;`
`a[5] = a[0];`

No bounds checking: `a[6] = 0xBAD;`
`a[-1] = 0xBAD;`

Pointers: `int* p;`
 equivalent `[p = a;`
`p = &a[0];`
`*p = 0xA;`

array indexing = address arithmetic
 (both scaled by the size of the type)

equivalent `[p[1] = 0xB;`
`* (p+1) = 0xB;`
`p = p + 2;`

store at $0x18 \rightarrow *p = a[1] + 1 = 0xC$

Arrays are adjacent locations in memory storing the same type of data object

`a` (array name) returns the array's address

`&a[i]` is the address of `a[0]` plus i times the element size in bytes

0x0	0x1	0x2	0x3	0x4	0x5	0x6	0x7	0xF	0x00
0x0	0x1	0x2	0x3	0x4	0x5	0x6	0x7	0xF	0x00
0x8	0x9	0xA	0xB	0xC	0xD	0xE	0xF		0x08
									0x10
									0x18
									0x20
									0x28
									0x30
									0x38
									0x40
									0x48

The diagram shows a memory layout for an array of integers. The array `a` has elements `a[0]`, `a[1]`, `a[2]`, `a[3]`, `a[4]`, and `a[5]`. The pointer `p` points to the first element `a[0]`. The memory addresses are aligned to 8 bytes. The values stored in memory are:

- `a[0]`: 0A 00 00 00 0B 00 00 00
- `a[1]`: 0C 00 00 00
- `a[2]`: AD 0B 00 00
- `a[3]`: 5F 01 00 00
- `a[4]`: AD 0B 00 00
- `a[5]`: 18 00 00 00

A blue arrow points from the label `p` to the first byte of `a[0]`. A red bracket indicates the range from `a[0]` to `a[4]`.

(no pointer arithmetic)

Arrays in C - Handout

Declaration: `int a[6];`

Indexing: `a[0] = 0x015f;`
`a[5] = a[0];`

No bounds
checking: `a[6] = 0xBAD;`
`a[-1] = 0xBAD;`

Pointers: `int* p;`
 equivalent `[p = a;`
`p = &a[0];`
`*p = 0xA;`

array indexing = address arithmetic
 (both scaled by the size of the type)

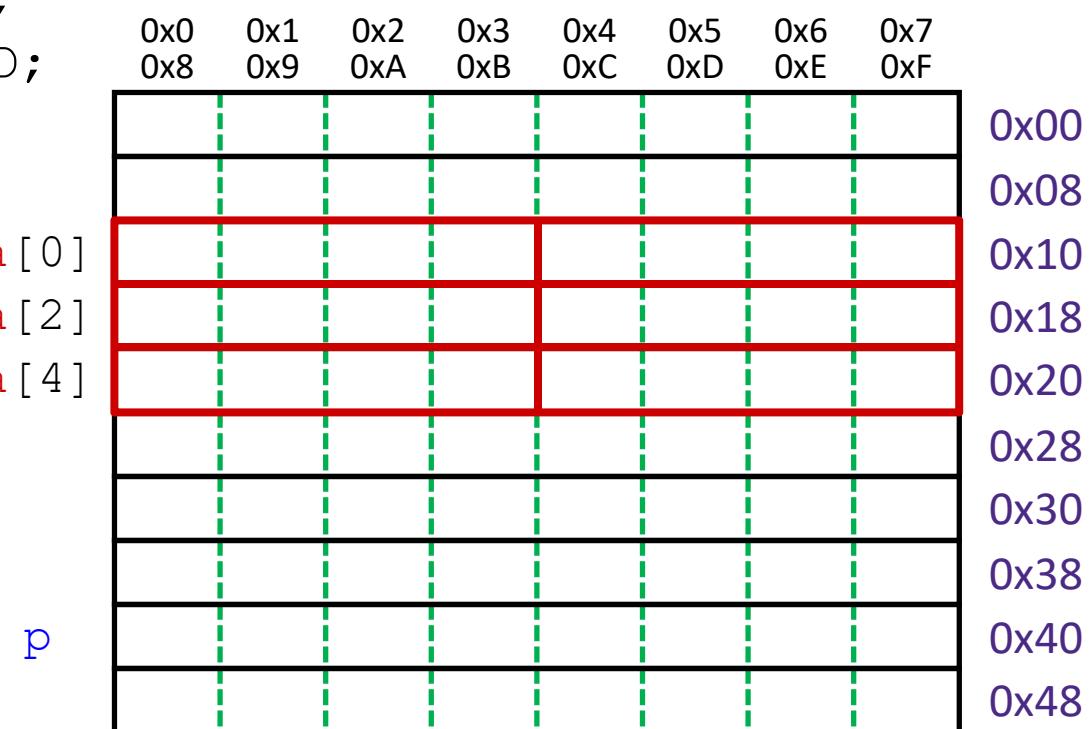

equivalent `[p[1] = 0xB;`
`* (p+1) = 0xB;`
`p = p + 2;`

`*p = a[1] + 1;`

Arrays are adjacent locations in memory
 storing the same type of data object

`a` (array name) returns the array's address

`&a[i]` is the address of `a[0]` plus `i` times
 the element size in bytes

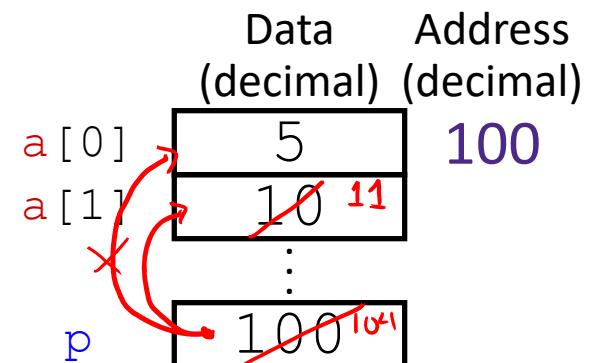

Question: The variable values after Line 3 executes are shown on the right. What are they after Line 4 & 5?

- Vote at <http://PollEv.com/reas>

```

1   void main() {
2       int a[] = {5, 10};
3       int* p = a;
4       p = p + 1; //sizeof(int) = 4
5       *p = *p + 1;
6   }

```

p After Line 4 *p a[0] a[1]

p After Line 5 *p a[0] a[1]

(A) 101 10 5 10 then 101 11 5 11

(B) 104 10 5 10 then 104 11 5 11

(C) 100 6 6 10 then 101 6 6 10

(D) 100 6 6 10 then 104 6 6 10

Representing strings

- ❖ C-style string stored as an array of bytes (**char***)
 - Elements are one-byte **ASCII codes** for each character
 - No “String” keyword, unlike Java

32	space	48	0	64	@	80	P	96	`	112	p
33	!	49	1	65	A	81	Q	97	a	113	q
34	"	50	2	66	B	82	R	98	b	114	r
35	#	51	3	67	C	83	S	99	c	115	s
36	\$	52	4	68	D	84	T	100	d	116	t
37	%	53	5	69	E	85	U	101	e	117	u
38	&	54	6	70	F	86	V	102	f	118	v
39	,	55	7	71	G	87	W	103	g	119	w
40	(56	8	72	H	88	X	104	h	120	x
41)	57	9	73	I	89	Y	105	i	121	y
42	*	58	:	74	J	90	Z	106	j	122	z
43	+	59	;	75	K	91	[107	k	123	{
44	,	60	<	76	L	92	\	108	l	124	
45	-	61	=	77	M	93]	109	m	125	}
46	.	62	>	78	N	94	^	110	n	126	~
47	/	63	?	79	O	95	_	111	o	127	del

ASCII: American Standard Code for Information Interchange

Null-Terminated Strings

- ❖ Example: "Donald Trump" stored as a 13-byte array

Decimal:	68	111	110	97	108	100	32	84	114	117	109	112	0
Hex:	0x44	0x6F	0x6E	0x61	0x6C	0x64	0x20	0x54	0x72	0x75	0x6D	0x70	0x00
Text:	D	o	n	a		d		T	r	u	m	p	\0

13 bytes total!

- ❖ Last character followed by a 0 byte (' \0 ')
(a.k.a. "null terminator")
- Must take into account when allocating space in memory
 - Note that '0' ≠ '\0' (i.e. character 0 has non-zero value)
- ❖ How do we compute the length of a string?
- Traverse array until null terminator encountered

Endianness and Strings

C (char = 1 byte)

char s [6] = "12345";

String literal

0x31 = 49 decimal = ASCII '1'

IA32, x86-64

(little-endian)

0x00	31
0x01	32
0x02	33
0x03	34
0x04	35
0x05	00

SPARC

(big-endian)

31	0x00	'1'
32	0x01	'2'
33	0x02	'3'
34	0x03	'4'
35	0x04	'5'
00	0x05	'\0'

- ❖ Byte ordering (endianness) is not an issue for 1-byte values
 - The whole array does not constitute a single value
 - Individual elements are values; chars are single bytes

Examining Data Representations

- ❖ Code to print byte representation of data
 - Any data type can be treated as a *byte array* by **casting** it to `char`
 - C has **unchecked** casts **!! DANGER !!**

```
void show_bytes(char* start, int len) {  
    int i;  
    for (i = 0; i < len; i++)  
        printf("%p\t0x%.2x\n", start+i, *(start+i));  
    printf("\n");  
}
```

printf directives:

%p	Print pointer
\t	Tab
%x	Print value as hex
\n	New line

Examining Data Representations

- ❖ Code to print byte representation of data
 - Any data type can be treated as a *byte array* by **casting** it to `char`
 - C has **unchecked casts** **!! DANGER !!**

```
void show_bytes(char* start, int len) {  
    int i;  
    for (i = 0; i < len; i++)  
        printf("%p\t0x%.2x\n", start+i, *(start+i));  
    printf("\n");  format string  
}  
                                         pointer arithmetic on  
                                         char*
```

```
void show_int(int x) {  
    show_bytes( (char *) &x, sizeof(int));  
}  
                                         int*  
                                         4 bytes  
                                         "cast"  
                                         (treat as)
```

show_bytes Execution Example

```
int x = 12345; // 0x00003039
printf("int x = %d;\n", x);
show_int(x); // show_bytes((char *) &x, sizeof(int));
```

- ❖ Result (Linux x86-64):
 - **Note:** The addresses will change on each run (try it!), but fall in same general range

```
int x = 12345;
0x7ffb7f71dbc      0x39
0x7ffb7f71dbd      0x30
0x7ffb7f71dbe      0x00
0x7ffb7f71dbf      0x00
```

Summary

- ❖ Assignment in C results in value being put in memory location
- ❖ Pointer is a C representation of a data address
 - `&` = “address of” operator
 - `*` = “value at address” or “dereference” operator
- ❖ Pointer arithmetic scales by size of target type
 - Convenient when accessing array-like structures in memory
 - Be careful when using – particularly when *casting* variables
- ❖ Arrays are adjacent locations in memory storing the same type of data object
 - Strings are null-terminated arrays of characters (ASCII)
